## Software Interface Specification

Interface Title:	<b>Camera &amp; LIBS Experiment Data Record (EDR) and Reduced Data Record (RDR) Data Products</b>	
Mission:	MSL	Date: December 17, 2015
Module ID:	SIS-SCI006-MSL	
Module Type (REFerence Only or MISSION-specific info included): MIS		
Reference Module ID:	N/A	Date: N/A

## Camera & LIBS Experiment Data Record (EDR) and Reduced Data Record (RDR) Data Products

Version 3.5

### Custodians:

Doug Alexander, Robert Deen

**JPL D-38107**

December 17, 2015

Jet Propulsion Laboratory  
California Institute of Technology

## CHANGE LOG

DATE	SECTIONS CHANGED	REASON FOR CHANGE	REVISION
8/14/13	<u>Section 6.1.1</u> <ul style="list-style-type: none"> <li>Added type “PRC” to list of RDR products for filename field “prodid”.</li> </ul> <u>Appendix A</u> <ul style="list-style-type: none"> <li>Added keyword SUN_VIEW_DIRECTION.</li> </ul> <u>Appendix F</u> <ul style="list-style-type: none"> <li>Added description for keyword SUN_VIEW_DIRECTION.</li> </ul>	Update	Version 3.5
9/14/13	<u>Section 4.2.4.2</u> <ul style="list-style-type: none"> <li>Added text updating NavMap EDR description.</li> </ul> <u>Section 5.2.1.9</u> <ul style="list-style-type: none"> <li>Added text clarifying the meaning of DN “0” in Arm Reachability products.</li> </ul> <u>Section 5.4</u> <ul style="list-style-type: none"> <li>Added text introducing concept of “shared” PDS label for four Mosaic files, with reference to new Appendix example.</li> </ul> <u>Appendix B</u> <ul style="list-style-type: none"> <li>Added this Appendix as example Mosaic RDR detached PDS label.</li> </ul>	Update	Version 3.5
3/2/14	<u>Sections 5.2.1.5 &amp; 5.3.1 &amp; 6.1.1</u> <ul style="list-style-type: none"> <li>Added “RNM” and as 3-char RDR product type.</li> </ul>	Update	Version 3.5
8/13/14	<u>Section 1.3</u> <ul style="list-style-type: none"> <li>Added “MER ICER User Guide” as reference.</li> </ul> <u>Sections 5.2.1.5 &amp; 5.3.1 &amp; 6.1.1</u> <ul style="list-style-type: none"> <li>Added “ZZO” and as 3-char RDR product type.</li> </ul> <u>Section 5.2.1.4.1</u> <ul style="list-style-type: none"> <li>Added this new section to describe Rover Mask RDR.</li> </ul> <u>Appendix A</u> <ul style="list-style-type: none"> <li>Updated columns for Mosaics to be “p” for keyword PRODUCT_VERSION_ID to reflect “only present in detached PDS labels”.</li> <li>Added Object “CCAM_SOH_EDR_ANCILLARY” to Chemcam EDR label.</li> <li>Added STEREO_BASELINE as Ops keyword.</li> </ul> <u>Appendix D</u> <ul style="list-style-type: none"> <li>Updated “CCAM_SOH_ANCIALLARY” FMT file.</li> <li>Added “CCAM_SOH_EDR_ANCIALLARY” FMT file.</li> </ul> <u>Appendix F</u> <ul style="list-style-type: none"> <li>Updated definition for keyword PRODUCT_VERSION_ID.</li> <li>Updated definition for keywords INST_CMPRS_SEGMENT_QUALITY and INST_CMPRS_SEGMENT_STATUS.</li> <li>Added keyword STEREO_BASELINE.</li> </ul>	Update	Version 3.5

DATE	SECTIONS CHANGED	REASON FOR CHANGE	REVISION
	<u>Appendix G</u> • Added keyword STEREO_BASELINE.

# 1. INTRODUCTION

## 1.1 Purpose and Scope

The purpose of this Data Product Software Interface Specification (SIS) is to provide consumers of MSL instrument Experiment Data Record (EDR) and Reduced Data Record (RDR) data products with a detailed description of the products and how they are generated, including data sources and destinations. Content in this document supports EDR and RDR data products generated by the Operations Product Generation Subsystem (OPGS) for the following instruments:

- Engineering Camera instrument suite:
  - a. Navigation Cameras (Navcams)
  - b. Hazard Avoidance Cameras (Hazcams)
- Chemistry Camera (ChemCam) instrument suite:
  - a. Remote Micro-imager (RMI) camera
  - b. Laser-Induced Breakdown Spectrometer (LIBS)

Note: The non-imaging LIBS instrument is included in this SIS because ChemCam science activities intertwine RMI imaging with LIBS spectra acquisition in the same general timeline. RMI imaging provides geomorphological context to the LIBS data. As a result, a portion of each instrument's data product metadata is common in context with the other, and it is convenient to describe all here in a single document.

Note: The ChemCam EDR data processing also includes extraction of specific state-of-health (SOH) metadata into a separate EDR.

- Malin Space Science Systems (MSSS) instrument suite:
  - a. Mast Camera (Mastcam)
  - b. Mars Hand Lens Imager (MAHLI)
  - c. Mars Descent Imager (MARDI)

Note: For convenience, the above instruments are often referred to in triplet as "MMM".

The users for whom this SIS is intended include OPGS, the Activity Planning and Sequencing Subsystem (APSS), users and developers of Science Operations Analysis Software (SOAS), member scientists of the project's Science Operations Working Group (SOWG) who will analyze the data, and other scientists in the general planetary science community.

In this document, the EDR data product is the raw, uncalibrated, uncorrected image data acquired by the MSL instrument. It may include decompression if there was data product compression performed onboard the rover by the instrument. Within the group of camera instruments, the full frame image EDR data products are identical in format, except for some product label differences. The LIBS spectrum EDR is of a different format than the image EDR, with a portion of the product label identical in label items to the image product.

The RDR data products described in this document are limited to camera instruments only, and are derived directly from one or more image EDR or image RDR data product(s). They are comprised of radiometrically decalibrated and/or camera model corrected and/or geometrically altered (including reprojected) versions of the raw camera data.

## 1.2 Contents

This Data Product SIS describes how the EDR data product is acquired by the MSL instrument and how it is processed, formatted, labeled, and uniquely identified, and how the image RDR data product is derived from image EDR or image RDR data products. The document discusses standards used in generating the product and software that may be used to access the product. The EDR and RDR data product structure and organization is described in sufficient detail to enable a user to read the product. Finally, examples of composite EDR/RDR labels are provided, along with the definitions of the keywords in the label.

## 1.3 Constraints and Applicable Documents

This SIS is meant to be consistent with the contract negotiated between the MSL Project and the MSL Principal Investigators (PI) for the Engineering cameras and ChemCam instrument suite in which reduced data records and documentation are explicitly defined as deliverable products. By agreement with the MMM instrument PI, products generated by OPGS from MMM data processing will be deliverable to the Project only in a backup capacity and will not be archived to the Planetary Data System (PDS). Because this SIS governs the specification of data products used during mission operations, any proposed changes to this SIS must be impacted by all affected software subsystems observing this SIS in support of operations (e.g., APSS, OPGS, SOAS).

Product label keywords may be added to future revisions of this SIS. Therefore, it is recommended that software designed to process EDRs and RDRs specified by this SIS should be robust to (new) unrecognized keywords.

This Data Product SIS is responsive to the following MSL documents:

1. Pointing, Positioning, Phasing & Coordinate Systems (3PCS), "Volume 1", Santi Udomkesmalee, MSL-376-1297, JPL D-34642, May 29, 2007.
2. Mars Science Laboratory Surface Attitude, Positioning, and Pointing Functional Design Description (FDD), Steve Peters, MSL-376-1089, JPL D-34217, December 13, 2010.
3. Mars Science Laboratory Surface Engineering Camera Imaging Functional Design Description (FDD), Justin Maki, MSL-375-1083, JPL D-34213, December 15, 2009.

## 2. INSTRUMENT OVERVIEW

In this section, overviews are provided for the three MSL instrument payload suites mentioned in the previous section: a) Engineering Camera instrument suite, b) ChemCam instrument suite, and c) MMM Camera instrument suite. Largely, the instruments described in this SIS are cameras, with the exception being the LIBS spectrometers in the ChemCam instrument suite. The LIBS instruments are included in this SIS based on some shared commonality in metadata with the RMI camera, a result due to the manner in which RMI images are used to document LIBS laser events.

The MSL rover instrument payload includes 17 individual cameras. The main differences between these instruments are in the optics, mounted position, and articulation methods. The cameras are monochromatic, except for the color-capable Mastcam. The engineering cameras (Navcam, Hazcam), share the identical electronics design and spacecraft interfaces. In these cases, the detectors are 1024×1024 pixel CCDs, and the electronics provide 12-bit analog-to-digital conversion. Of the 17 cameras, there are 4 sets of stereo pairs and three single cameras, as listed in Table 2a below.

**Table 2a - Tabulation of MSL Cameras**

MSL Camera Instrument	Location	Number
Navigation Camera (Navcam)	Stereo pair on Remote Sensing Mast (RSM)	4
“Front” Hazard Avoidance Camera (Hazcam)	Stereo pair at front of Warm Electronics Box (WEB)	4
“Rear” Hazard Avoidance Camera (Hazcam)	Stereo pair at rear of WEB	4
Remote Micro-imaging (RMI of ChemCam)	Monoscopic on RSM	1
Mast Camera (Mastcam)	Stereo pair on RSM	2
Mars Hand Lens Imager (MAHLI)	Robotic Arm	1
Mars Descent Imager (MARDI)	WEB	1
TOTAL		17

The MSL rover instrument payload also includes the LIBS instrument, comprised of multiple lasers and spectrometers. It shares use of a telescope, boresighted on the RSM with the Mastcam and Navcam, with the RMI camera to ensure targeting the lasers on the same spots imaged by the RMI. See Table 2b below for the LIBS components.

**Table 2b - Tabulation of LIBS Components**

LIBS Instrument Component	Location	Number
LIBS laser	Mast Unit (RSM)	1
Continuous Wave (CW) laser	Mast Unit (RSM)	1
LIBS telescope	Mast Unit (RSM)	1
Spectrometers (Near-Infrared, Visible, Ultra-violet)	Body Unit (WEB)	3
TOTAL		6

Camera and LIBS mounting locations are shown in Figure 2 below.

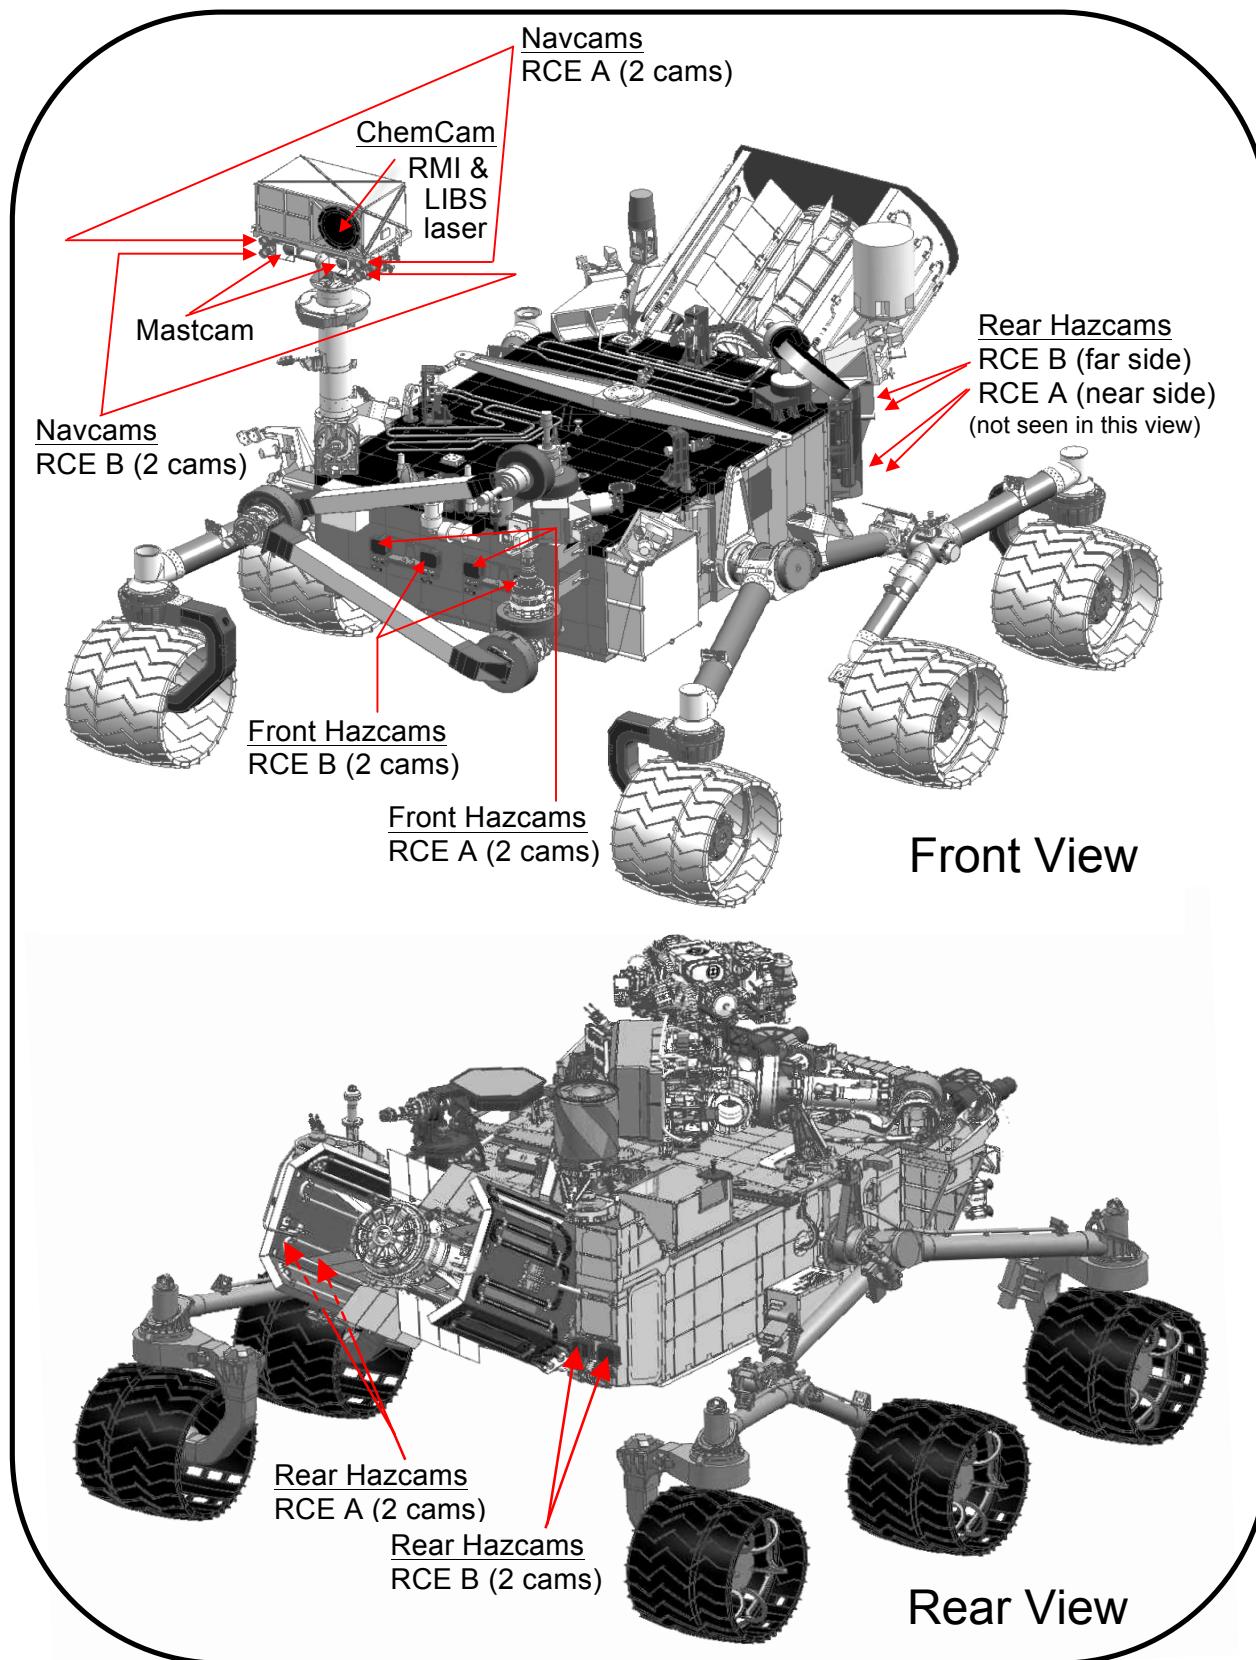

Figure 2 - MSL Camera and LIBS Locations

## 2.1 Engineering Camera Instrument Suite

The Engineering Camera instrument suite is comprised of the Hazcams and Navcams for the purposes of providing near-range (Hazcams) and mid-range (Navcam) fields-of-view to facilitate image acquisition important to rover traverse planning. For each camera, a total of 1024 x 1024 image pixels plus 32 reference pixels per line (totaling 1024 x 1056) are each digitized to 12 bits resolution. For details about the bit processing of the scene content, refer to Section 4.4.1. The camera acquisition of the scene in hardware, beginning at origin (0,0), and subsequent onboard storage and readout of EDR image data is illustrated in Figure 2.1 below. Note that the image product label references (1,1) as the starting line and starting sample, respectively. Reference Pixels are returned separately:

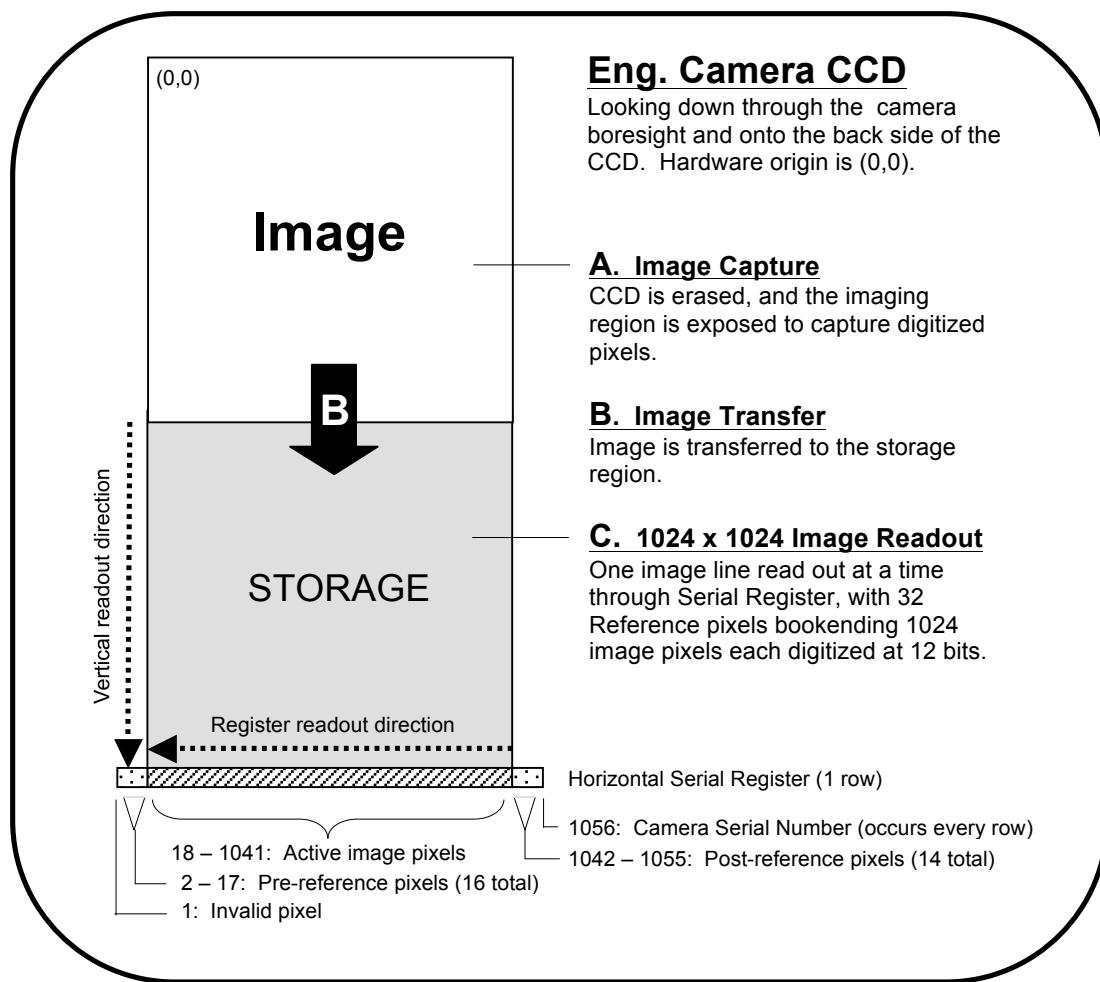

Figure 2.1 - Acquisition and Readout of Engineering Camera Image Data

## 2.1.1 Hazard Avoidance Camera (Hazcam)

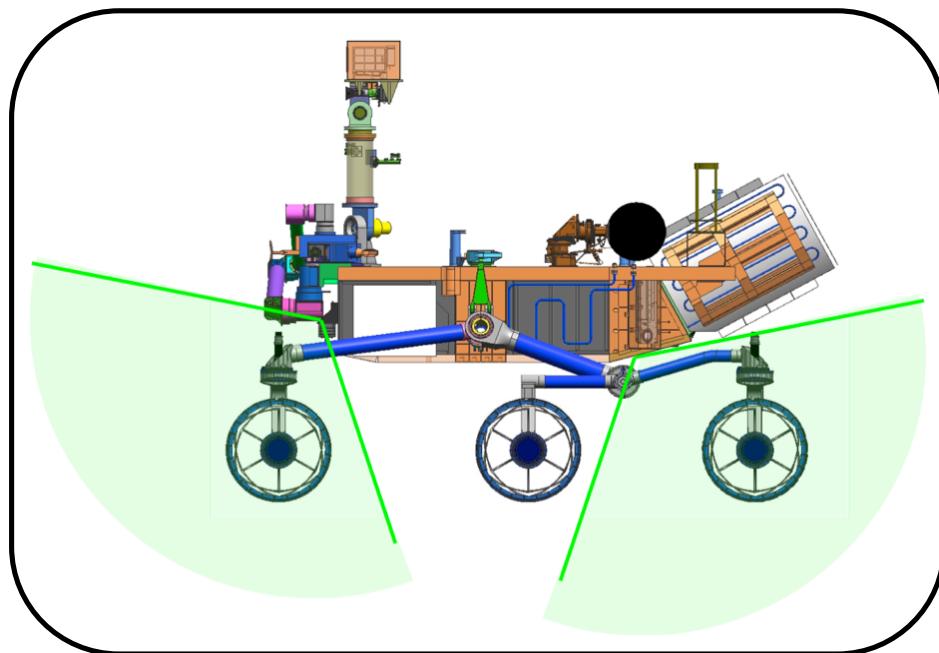

The Hazard Avoidance Cameras (Hazcams) are two stereo pairs of engineering cameras with fish-eye lenses at 16 cm (front) and 10 cm (rear) baseline separation mounted at both the front and rear ends of the Warm Electronics Box (WEB). Hazcam assembly includes 2 cameras with a fixed Red 200 nm bandpass filter (identical to the Navcams).

The Hazcams provide imaging primarily of the near field (< 5 m) both in front of and behind the rover. These cameras will be used to determine safe driving directions for the rover and provide for on-board hazard detection using stereo data to build range maps. They also support science operations for selecting near field target and robotic arm operations.

Hazcam optics characteristics useful in the analysis of EDR and RDR products are described in Table 2.1.1, with Hazcam fields of view shown in Figure 2.1.1 below:

**Table 2.1.1 - Hazcam Operational Characteristics**

Characteristic	Value
Field of View (FOV)	124 x 124 deg
Baseline Stereo Separation	16 cm for front, 10 cm for rear
Angular Resolution	2.1 mrad/pixel at center
Spectral Bandpass	600 - 800 nm
Focal Length	5.58 mm
f/number	15
Depth of Field	0.1 m - infinity
Best Focus	0.5 m

**Figure 2.1.1 - Hazcam Fields of View**

## 2.1.2 Navigation Camera (Navcam)

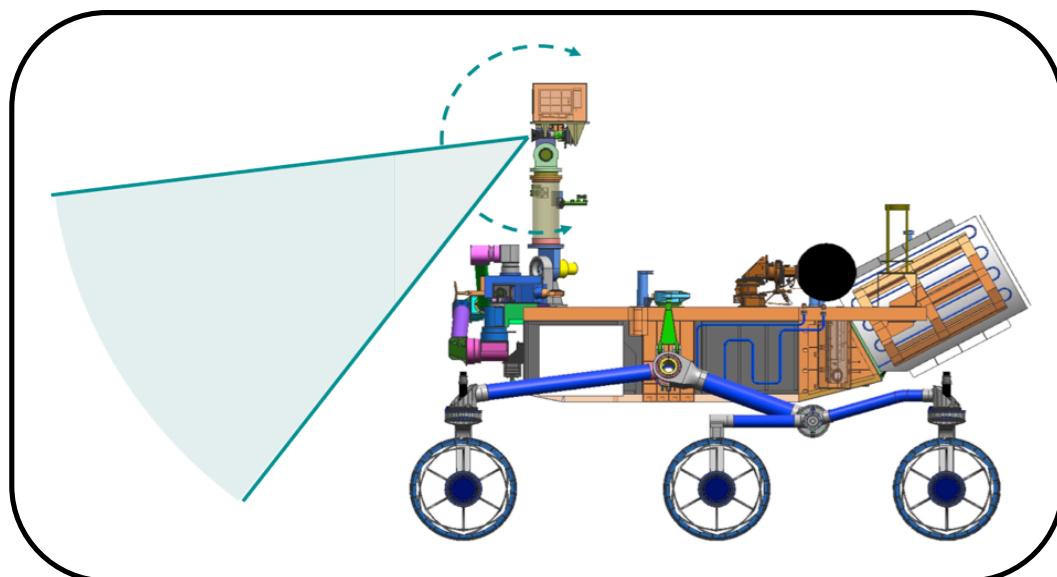

The Navigation Camera (Navcam) is two mast-mounted stereo pairs of engineering cameras at 42.4 cm baseline separation with a spectral bandpass at approximately 200 nm. It will primarily be used for navigation purposes and general site characterization (360° panoramic images and targeted images of interest, including terrain not viewable by the Hazcams).

The cameras are boresighted with the Mastcam, and Navcam images will also be used for Science target selection and analysis.

Navcam optics characteristics useful in the analysis of EDR and RDR products are described in Table 2.1.2, with Navcam field of view shown in Figure 2.1.2 below:

**Table 2.1.2 - Navcam Operational Characteristics**

Characteristic	Value
Field of View (FOV)	45 x 45 deg
Baseline Stereo Separation	42.4 cm
Angular Resolution	0.82 mrad/pixel at center
Spectral Bandpass	600 - 800 nm
Focal Length	14.67 mm
f/number	12
Depth of Field	0.5 m - infinity
Best Focus	1.0 m

**Figure 2.1.2 - Navcam Field of View**

## 2.2 ChemCam Instrument Suite

The ChemCam instrument suite is a spectroscopy science payload comprised of the RMI camera subsystem and the LIBS laser/spectrometer subsystem. The ChemCam instrument payload is packaged onboard the rover in two instrumentation units: a) the Mast Unit (affixed to the RSM), and b), the Body Unit (housed within the rover WEB), both shown in Figure 2.2.1.

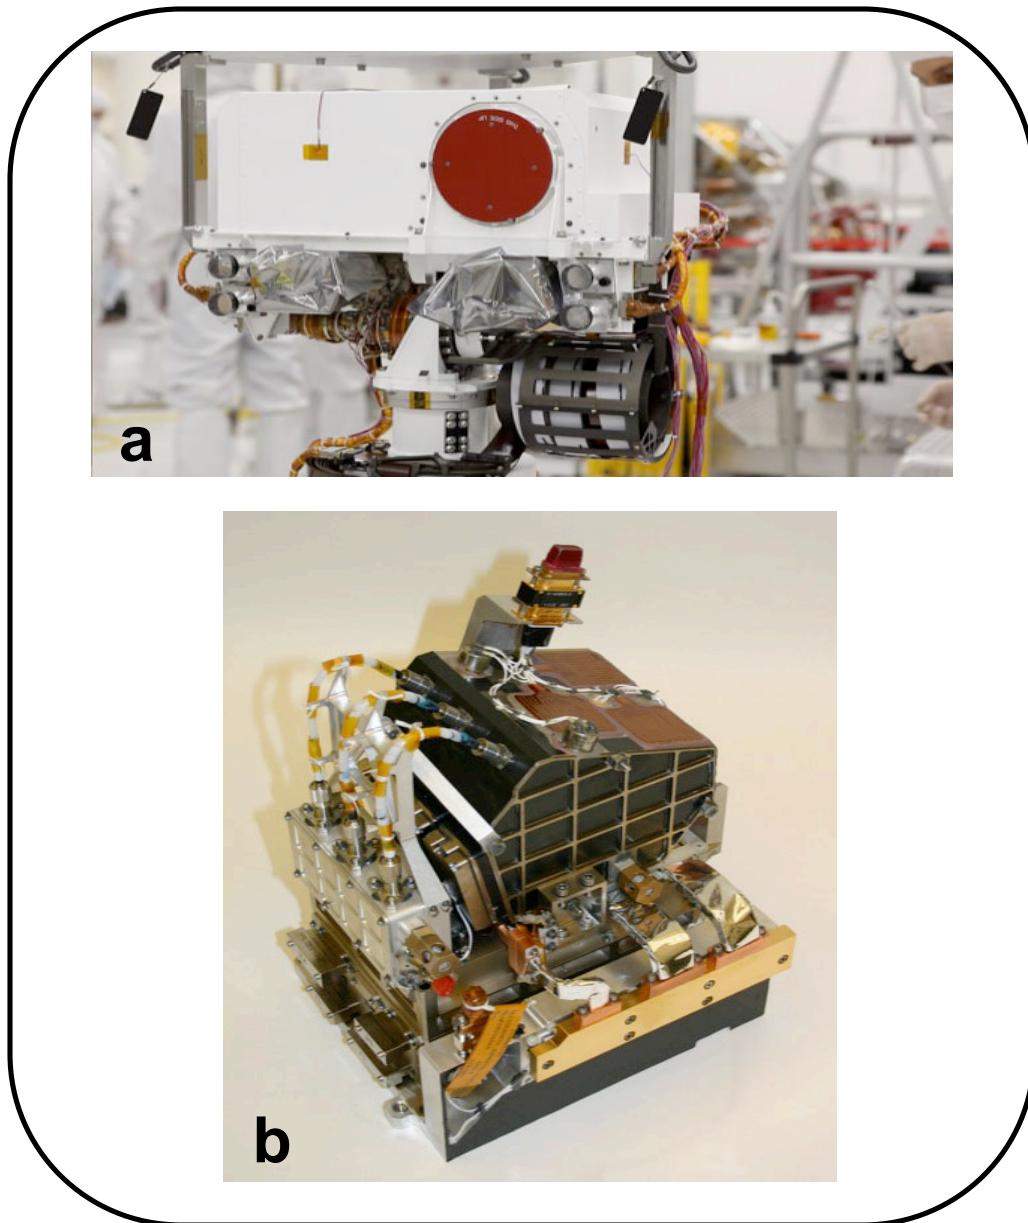

Figure 2.2.1 – Mast Unit (a) in white housing with red telescope cover, and Body Unit (b)

The RMI and lasers are contained in the Mast Unit and the spectrometers reside in the Body Unit. The LIBS will focus powerful laser pulses on targets and then determine the elemental compositions by measuring the emission lines from the ablated material in three spectral ranges. Within the Mast Unit, the design provides for the optical paths of the RMI camera and LIBS lasers to be co-aligned by using the same telescope component, enabling the focus spot for each to be registered to the same target. In this manner, the RMI data provides geomorphological context to the LIBS spectroscopy activity in image format. Refer to Figure 2.2.2 for a schematic illustration of the interfaces in a typical event.

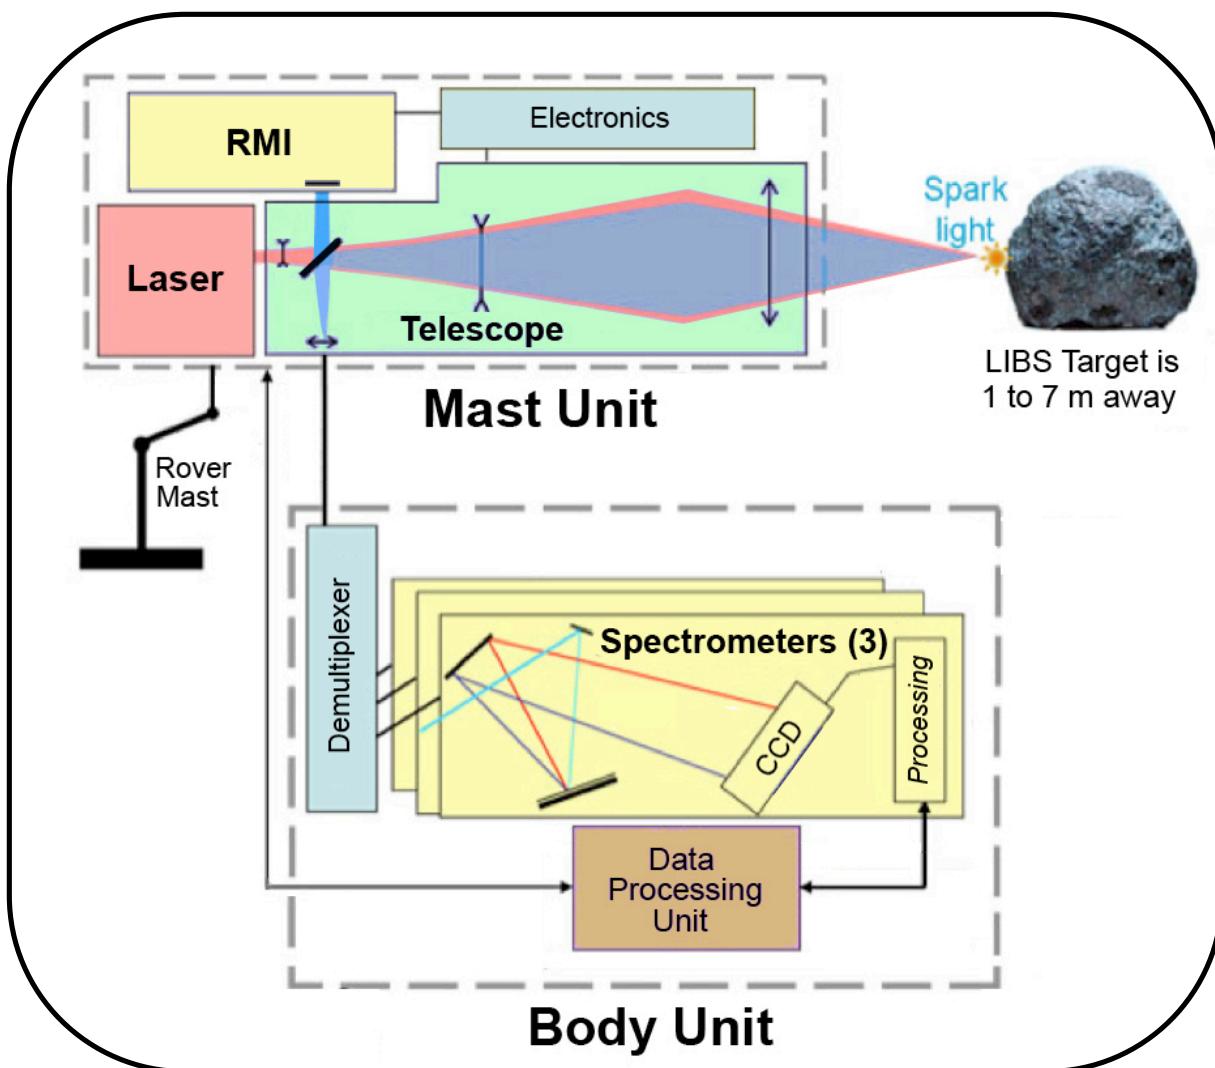

Figure 2.2.2 - Block Diagram of LIBS Spectroscopy Event

## 2.2.1 Remote Micro-Imager (RMI) Camera

The Remote Micro-Imager (RMI) camera provides high-resolution context images of the LIBS sampling area as well as imaging rock morphologies and distant features. It includes an adjustable focus capability. A total of 1024 x 1024 image pixels plus 16 reference pixels on the left per line and

12 reference pixels on the top and bottom (24 total) are each digitized to 10 bits/pixel resolution. Its pixel field of view is 21-22  $\mu$ rad. Its effective resolution exceeds that of MER Pancam by a factor of 5 to 10. Resolution in the near-field is within a factor of 2-3 of MER MI (at closest-focus distance of 1 m for RMI versus 6 cm for MI). As with the engineering cameras, the binary data may be returned uncompressed or compressed. The Reference Pixels are returned separately. For details about the bit processing of the scene content, refer to Section 4.4.2.

RMI optics characteristics useful in the analysis of EDR and RDR products are described in Table 2.2.1.1 below:

**Table 2.2.1.1 - RMI Operational Characteristics**

Characteristic	Value
Field of View (FOV)	22.5 mrad
Spatial Resolution	< 1 mm @ 10 m
Angular Resolution	78-85 $\mu$ rad vertical, 87-105 $\mu$ rad horizontal
Spectral Bandpass	$\sim$ 250 - 900 nm
Focus Range	1.161 m to infinity
Number of Spectral Filters	1

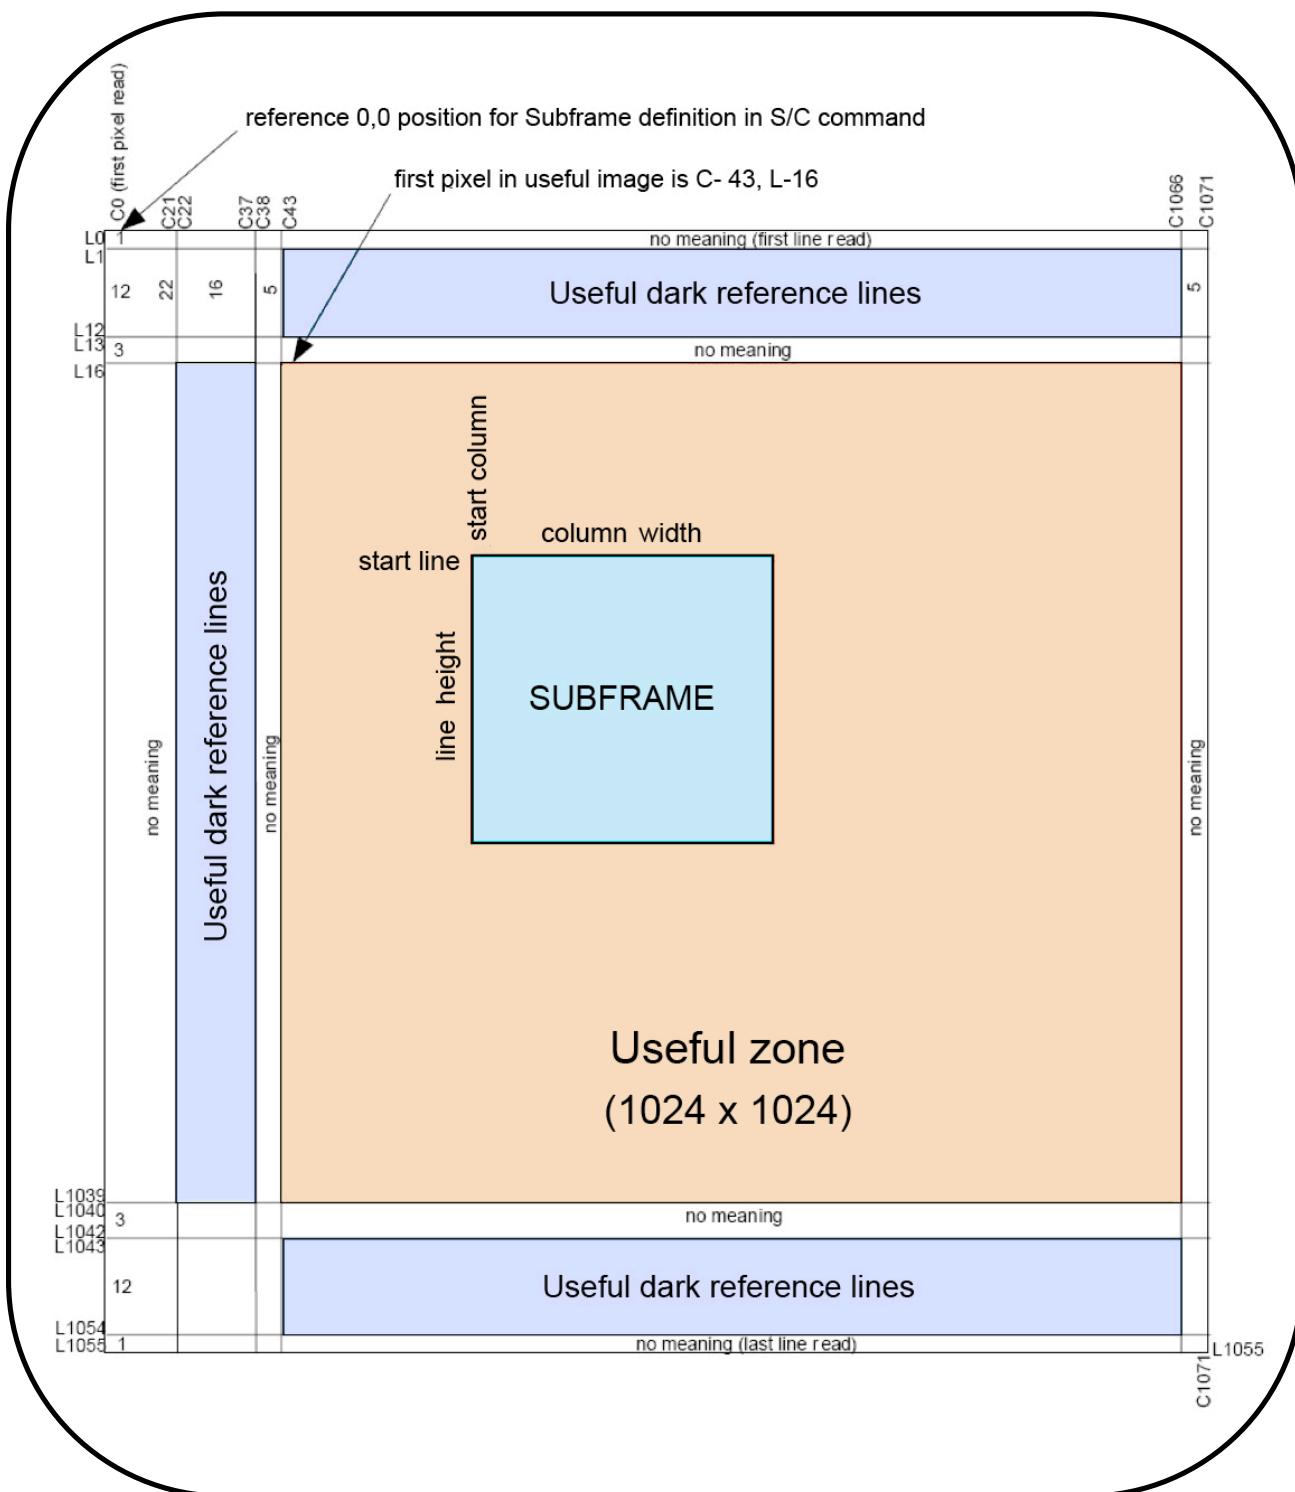

RMI image data return compression modes are listed in Table 2.2.1.2 below:

**Table 2.2.1.2 - RMI Image Compression Modes**

Mode	Description	Factor
0	No compression	1
1	LOCO compression (done by RCE)	2
2	ICER compression (done by RCE)	10
3	Region-of-Interest, or ROI * (done by RCE)	64

\* ROI size is variable and commandable from 8x8 pixels up to 1024x1024 pixels (128x128 is default) and the ROI can be rectangular (i.e., 256x128 pixels) if desired.

The camera acquisition of the scene and subsequent onboard storage and readout of image data is illustrated in Figure 2.2.1.1 below:

**Figure 2.2.1.1 - Acquisition and Readout of RMI Camera Image Data**

Generally, a subframe image in any size from 8x8 to 1024x1024 (default is 128x128, rectangular is possible on board) will be made prior to LIBS analysis, while after the laser shots a full frame image that includes the region of interest around the analyzed spot will be acquired. In addition to the 1024x1024 useful image area, the full image contains a prescan area (1024x22), a dark area (1024x16) and a reference pixel (dark collapsed to 1). Alternatively, the image may consist of a 16x16 or 32x32 thumbnail, computed on board, without the extra elements. The returned product depends on the image compression option and the size of the frame, and generally should be turned into a useful image record.

## 2.2.2 Laser-induced Breakdown Spectrometer (LIBS)

The ChemCam LIBS instrument payload has two lasers and three spectrometers distributed in two instrumentation units: the Mast Unit on the RSM, and the Body Unit housed in the rover WEB. The lasers reside in the Mast Unit and include a) the LIBS laser, a very high powered beam used to ablate targeted material, and b) the Continuous Wave (CW) laser, used for the autofocus function of the LIBS instrument. The spectrometers reside in the Body Unit. Figure 2.2.2, shown previously in Section 2.2, schematically illustrates the spectroscopy of a rock target, with the active LIBS components configured in Mast and Body Units. The LIBS activity involves the lasers focusing on a small spot on target rock and soil samples within 15 m of the rover to ablate atoms and ions in electronically excited states, from which they decay, producing an illuminated plasma analyzed by the spectrometers.

Some general operational characteristics of LIBS are listed in Table 2.2.2.1 below:

**Table 2.2.2.1 – LIBS Operational Characteristics**

Characteristic	Value
Focus Range	$\geq 1.161$ m
Spectrometer Field of View (FOV)	0.65 mrad FWHM
Spectral Bandpass	240.8 – 905.5 nm
Pointing Accuracy in Mast context	$\pm 4$ mrad

The three LIBS spectrometers produce raw or averaged spectra in three different wavelength ranges. Each spectrum is coded on the center 2048 out of 2148 channels (it is also possible to return a 2D diagnostic image 2048x256). The three spectra are combined into one product. The measurement can be done after a laser shot (active spectra), without laser activation (passive spectra), or on the calibration targets. In these three cases, the same type of product or record is returned. Figure 2.2.2.1 illustrates LIBS spectra data plotted for the three spectrometer cases as a means of visualizing the spectra measurements.

*Relative Intensity to the Maximum*

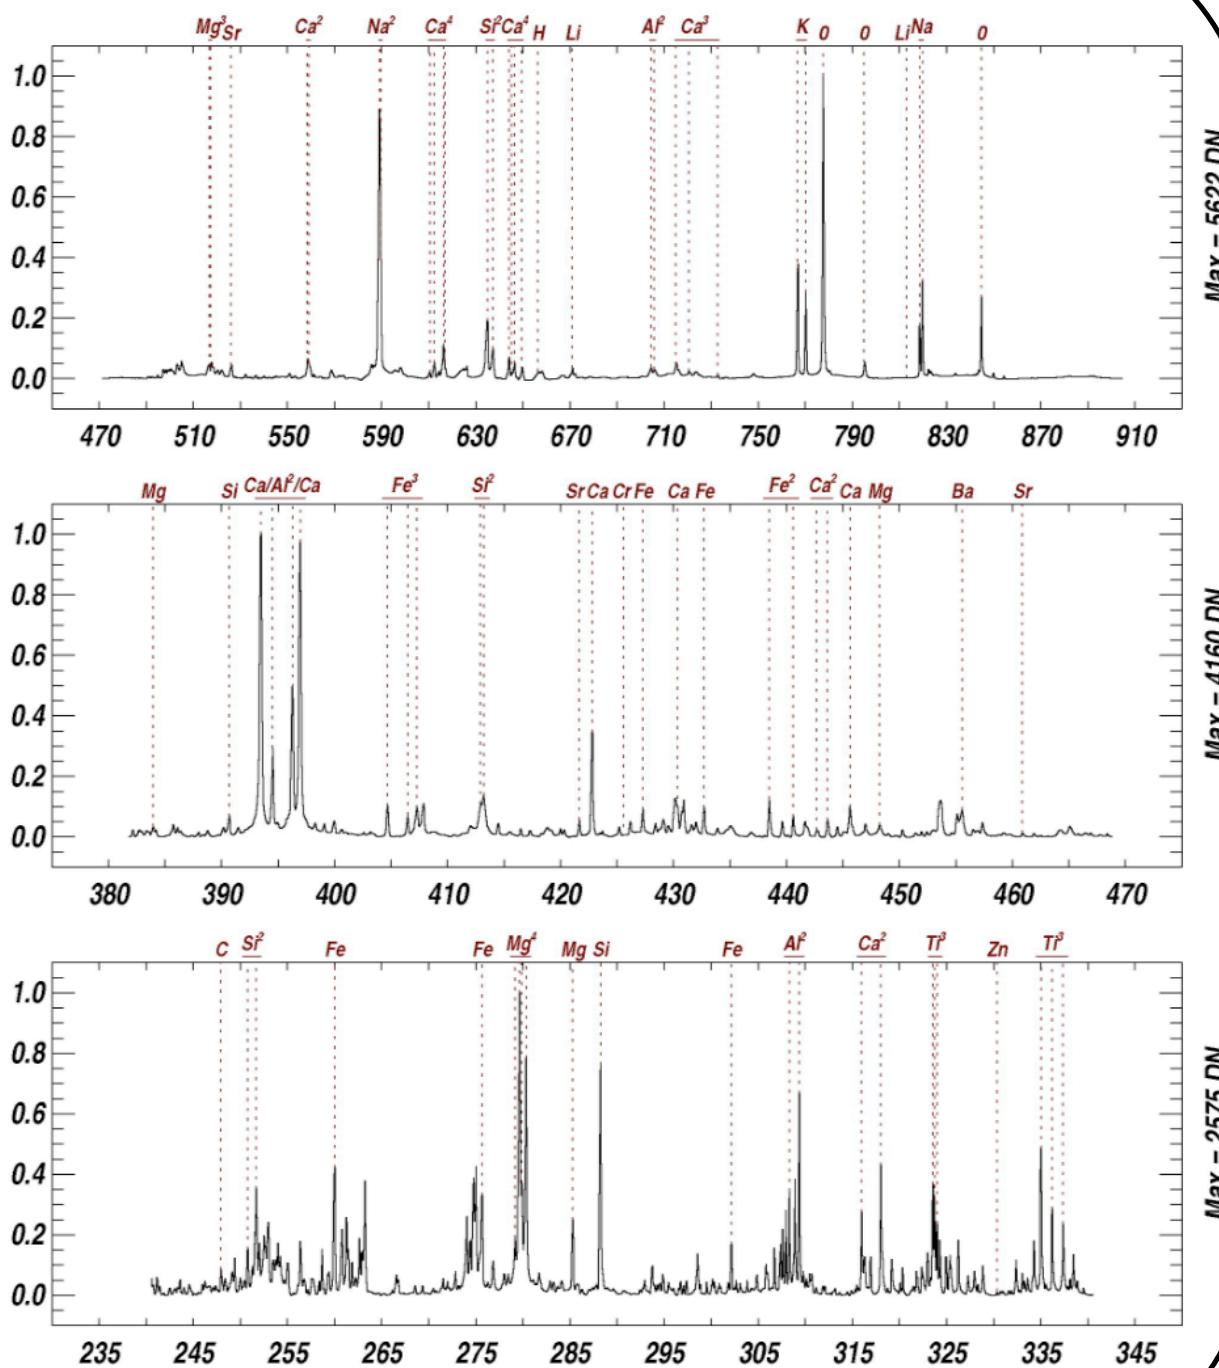

Figure 2.2.2.1 – Spectrum Data Plotted for Three LIBS Spectrometers

## 2.3 MMM Camera Instrument Suite

### 2.3.1 Mast Camera (Mastcam)

The Mast Camera (Mastcam) is comprised of a pair of color-capable focusable stereo cameras (“eyes”) mounted on the rover’s Remote Sensing Mast (RSM). Each camera has a different focal length and set of filters. Together, they can acquire images of up to 1600 x 1200 pixels and are capable of video. They acquire color via Bayer-pattern filters on the CCD, but also have selectable filters for science/geology applications. For more details on Bayer pattern filters, see Section 4.3.3.1.

Mastcam optics characteristics that are useful in the analysis of EDR and RDR products are described in Table 2.3.1.1 below:

**Table 2.3.1.1 - Mastcam Operational Characteristics**

Characteristic	Left Eye (M-34)	Right Eye (M-100)
Field of View (FOV)	15 x 15 deg	5.1 x 5.1 deg
Baseline Stereo Separation	24.5 cm	24.5 cm
Spatial Resolution	450 $\mu$ rad/pixel at 2 m, 22 cm/pixel at 1 km	150 $\mu$ rad/pixel at 2 m, 7.4 cm/pixel at 1 km
Angular Resolution	0.22 mrad/pixel	0.074 mrad/pixel
Focal Length	34 mm	100 mm
f/number	8	10
Focus Range	2.1 - infinity	2.1 - infinity
Number of Spectral Filters	8 plus Bayer pattern	8 plus Bayer pattern

Each Mastcam camera has an 8-position filter wheel. One of the positions is a broadband filter for use with the Bayer color capability of the CCD. One additional filter per eye has a neutral density coating to provide direct solar imaging capability in two colors. The remaining filters are used for science imaging.

Thirteen of the sixteen filters provide color imaging capability in eleven unique wavelengths from 400 to 1100 nm, two of the remaining filters have neutral density coatings to provide direct solar imaging capability in two colors, and one filter wheel position has been left empty to provide for maximum broadband light sensitivity. The spectral bandwidths [Ref 28] are described in Table 2.3.1.2 below:

**Table 2.3.1.2 - Mastcam Spectral Filters and Bandpasses**

Filter Position	Left Eye Wavelength ( $\pm$ Bandwidth), $\lambda_{\text{eff}} \pm \text{HWHM}$ (nm)	Right Eye Wavelength ( $\pm$ Bandwidth), $\lambda_{\text{eff}} \pm \text{HWHM}$ (nm)
0	590 $\pm$ 88 (Broadband)	575 $\pm$ 90 (Broadband)
	640 $\pm$ 44 (Bayer filter Red)	638 $\pm$ 44 (Bayer filter Red)
	554 $\pm$ 38 (Bayer filter Green)	551 $\pm$ 39 (Bayer filter Green)
	495 $\pm$ 37 (Bayer filter Blue)	493 $\pm$ 38 (Bayer filter Blue)
1	527 $\pm$ 7	527 $\pm$ 7
2	445 $\pm$ 10	447 $\pm$ 10
3	751 $\pm$ 10	805 $\pm$ 10
4	676 $\pm$ 10	908 $\pm$ 10
5	867 $\pm$ 10	937 $\pm$ 10
6	1012 $\pm$ 21	1013 $\pm$ 21
7	880 $\pm$ 10 ND5	440 $\pm$ 20 ND5

The Mastcam filter response profiles, including those of the RGB Bayer filters, are plotted below for the left (M-34) and right (M-100) camera eyes in two separate figures. Figure 2.3.1.2.1 [Ref 28] shows the Bayer filter profiles in red, green and blue when the filter wheel is set to Filter 0 (broadband IR cutoff shown as dashed line).

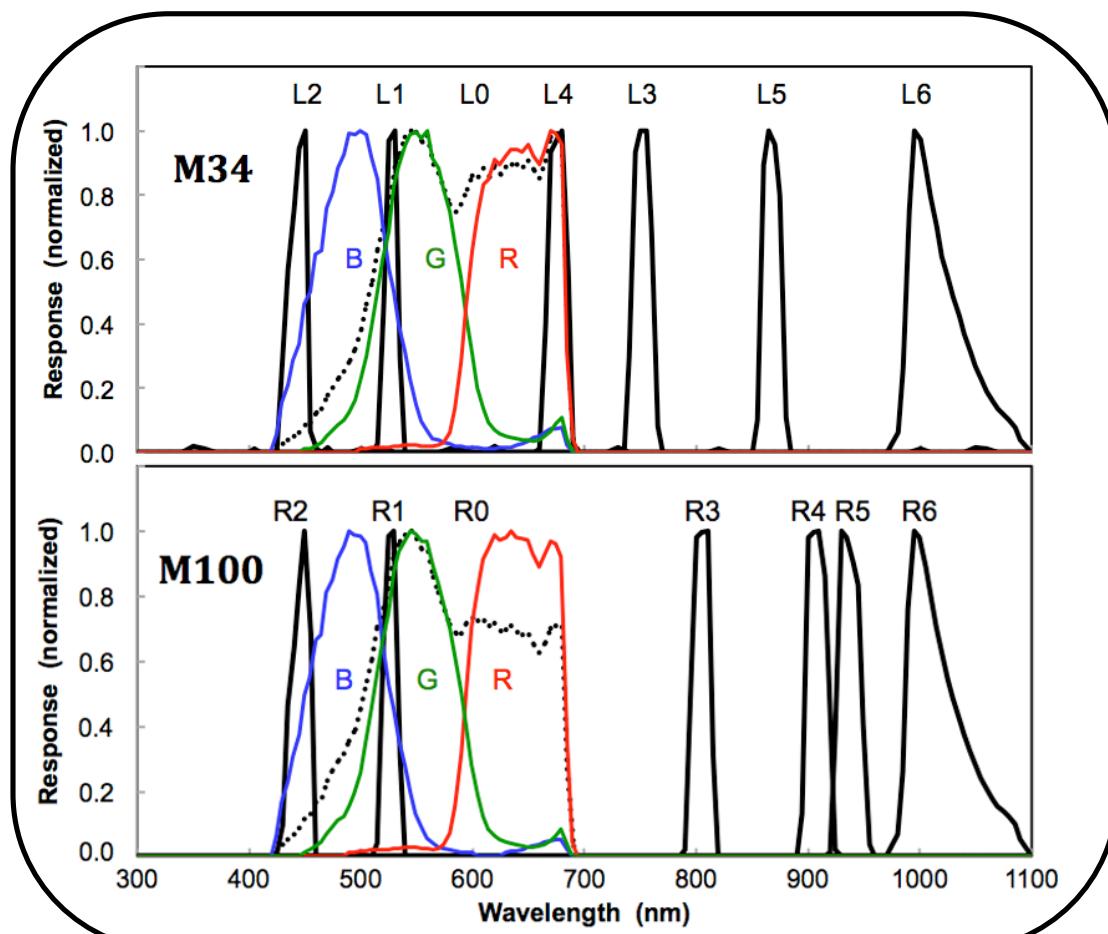

**Figure 2.3.1.2.1 - Mastcam Filter Profiles, Filter Wheel Set to Filter 0**

Figure 2.3.1.2.2 [Ref 29] shows the Bayer filter profiles in red, green and blue when the filter wheel is set to a nonzero number. Additionally, the quantum efficiency of the CCD detector is graphically depicted as a dashed line. The Bayer filter array and CCD quantum efficiency profiles are not shown to scale.

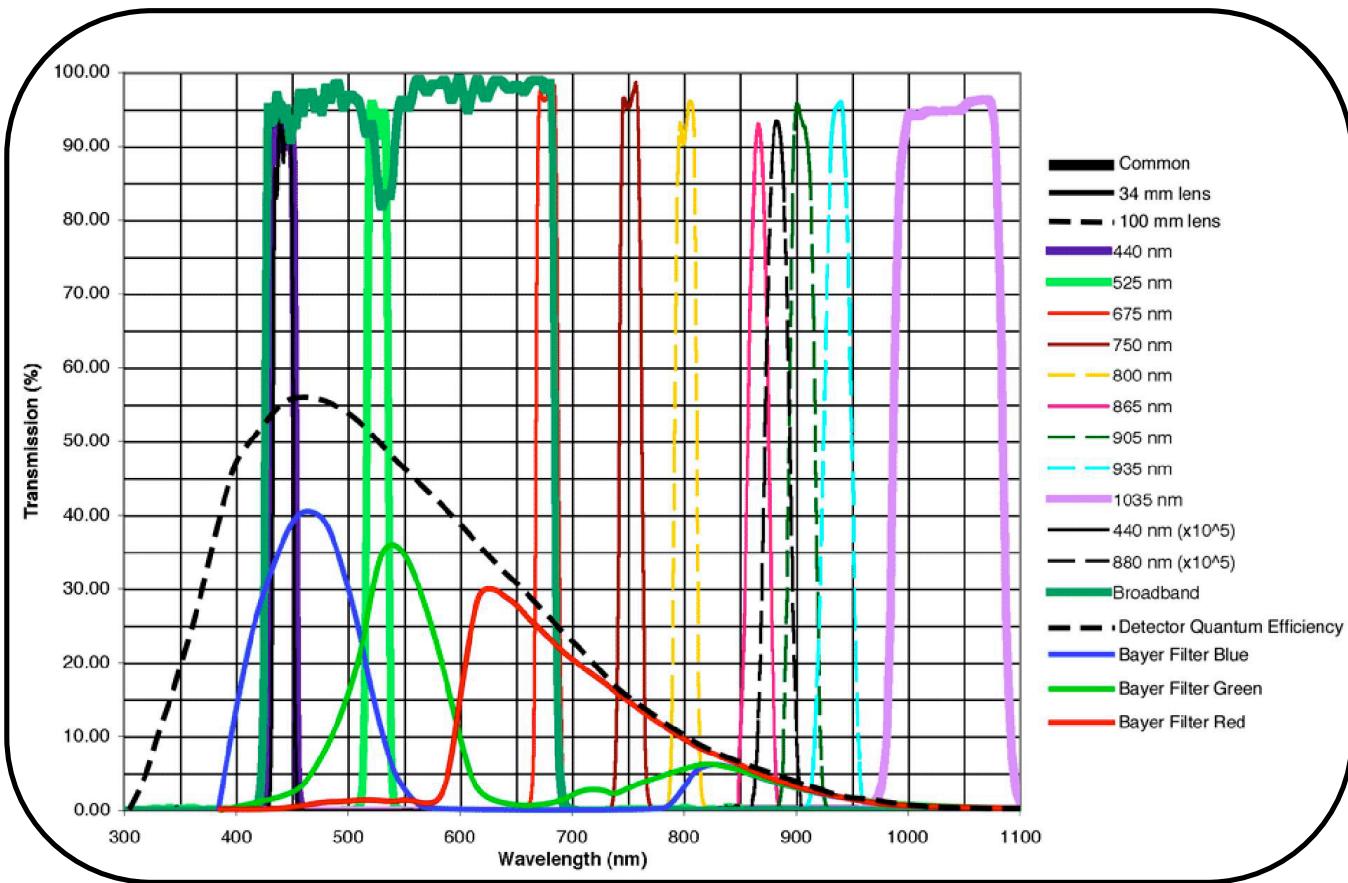

Figure 2.3.1.2.2 - Mastcam Filter Profiles, Filter Wheel Set to Nonzero

## 2.3.2 Mars Hand Lens Imager (MAHLI)

The Mars Hand Lens Imager (MAHLI) is a focusable color camera located on the turret at the end of the MSL robotic arm. The instrument acquires images of up to 1600 by 1200 pixels with a color quality equivalent to that of consumer digital cameras using a Bayer pattern. For details on Bayer pattern filters, see Section 4.3.3.1. It is also capable of video. MAHLI optics characteristics useful in the analysis of EDR and RDR products are described in Table 2.3.2 below.

**Table 2.3.2 - MAHLI Operational Characteristics**

Characteristic	Value
Field of View (FOV)	34.0 - 39.4 deg diagonal
Spatial Resolution	15 $\mu\text{m}/\text{pixel}$ at 25 mm distance
Angular Resolution	0.3 - 0.34 mrad/pixel
Spectral Wavelength $\pm$ Bandwidth ( $\lambda_{\text{eff}} \pm \text{HWHM}$ )	590 $\pm$ 88 nm (Broadband) 640 $\pm$ 44 nm (Bayer filter Red) 554 $\pm$ 38 nm (Bayer filter Green) 495 $\pm$ 37 nm (Bayer filter Blue)
Focal Length	18.3 - 21.3 mm
f/number	9.8 - 8.5
Depth of Field	1.6 mm - >4800 mm
Focus Range	20.5 mm - infinity
Number of Spectral Filters	1 plus Bayer pattern on CCD

Note that the spatial resolution in Table 2.3.2 measures the working distance, which is not the same as the distance from the camera model (C) point. Spatial resolution may be calculated by:

$$\text{Pixel scale } (\mu\text{m/pixel}) = 6.9001 + [3.5201 * \text{Working Distance (cm)}]$$

Note also that the spectral bandpasses in Table 2.3.2 are approximate and use the Left Mastcam bandpasses as the representative values.

### 2.3.3 Descent Imager (MARDI)

The Mars Descent Imager (MARDI) is a fixed-focus color camera fixed-body-mounted to the fore-port-side of the MSL rover, even with the bottom of the rover chassis. The optical axis points in the +Z direction (toward the ground in the Rover Nav coordinate systems). The camera will take 1600 x 1200 pixel images at ~5 frames per second throughout the period of time between heatshield separation and touchdown plus a few seconds. MARDI optics characteristics useful in the analysis of EDR and RDR products are described in Table 2.3.3 below. For details on Bayer pattern filters, see Section 4.3.3.1.

**Table 2.3.3 - MARDI Operational Characteristics**

<b>Characteristic</b>	<b>Value</b>
Field of View (FOV)	70 - 55 deg
Spatial Resolution	1.5 m at 2 km - 1.5 mm at 2 m
Angular Resolution	0.76 mrad/pixel
Spectral Wavelength $\pm$ Bandwidth ( $\lambda_{\text{eff}} \pm \text{HWHM}$ )	590 $\pm$ 88 nm (Broadband) 640 $\pm$ 44 nm (Bayer filter Red) 554 $\pm$ 38 nm (Bayer filter Green) 495 $\pm$ 37 nm (Bayer filter Blue)
Depth of Field	2 m - infinity
Number of Spectral Filters	1 plus Bayer pattern on CCD

Note that the spectral bandpasses in Table 2.3.3 are approximate and use the Left Mastcam bandpasses as the representative values.

## 3. GENERAL DATA PRODUCT OVERVIEW

### 3.1 Data Processing Levels

This documentation uses the “Committee on Data Management and Computation” (CODMAC) data level numbering system. The MSL camera instrument EDRs referred to in this document are considered “Level 2” or “Edited Data” (equivalent to NASA Level 0). The EDRs are to be reconstructed from “Level 1” or “Raw Data”, which are the telemetry packets within the project specific Standard Formatted Data Unit (SFDU) record. They are to be assembled into complete images, but will not be radiometrically or geometrically corrected.

MSL camera instrument RDRs are considered “Level 3” (“Calibrated Data” equivalent to NASA Level 1-A), “Level 4” (“Resampled Data” equivalent to NASA Level 1-B), or “Level 5” (“Derived Data” equivalent to NASA Level 1-C, 2 or 3). The RDRs are to be reconstructed from “Level 2” edited data, and are to be assembled into complete images that may include radiometric and/or geometric correction.

Refer to Table 3.1 for a breakdown of the CODMAC and NASA data processing levels.

**Table 3.1 - Processing Levels for Science Data Sets**

NASA	CODMAC	Description
Packet data	Raw - Level 1	Telemetry data stream as received at the ground station, with science and engineering data embedded.
Level 0	Edited - Level 2	Instrument science data (e.g., raw voltages, counts) at full resolution, time ordered, with duplicates and transmission errors removed.
Level 1-A	Calibrated - Level 3	Level 0 data that have been located in space and may have been transformed (e.g., calibrated, rearranged) in a reversible manner and packaged with needed ancillary and auxiliary data (e.g., radiances with the calibration equations applied).
Level 1-B	Resampled - Level 4	Irreversibly transformed (e.g., resampled, remapped, calibrated) values of the instrument measurements (e.g., radiances, magnetic field strength).
Level 1-C	Derived - Level 5	Level 1A or 1B data that have been resampled and mapped onto uniform space-time grids. The data are calibrated (i.e., radiometrically corrected) and may have additional corrections applied (e.g., terrain correction).
Level 2	Derived - Level 5	Geophysical parameters, generally derived from Level 1 data, and located in space and time commensurate with instrument location, pointing, and sampling.
Level 3	Derived - Level 5	Geophysical parameters mapped onto uniform space-time grids.

## 3.2 Product Label and Header Descriptions

### 3.2.1 Overview of Labels

There are up to three different sets of product labels (metadata) that can be associated with an EDR/RDR file, to be described subsequently in this section: a) detached PDS (version 3) label, b) attached ODL (Object Description Language) [Ref 4] label, and c) attached VICAR (Video Communications and Retrieval) label. While formats and keywords may differ, all three can be reliably used to extract metadata.

It is important to note that, with one exception, the three possible labels contain the same semantic information and are in sync with each other. The exception is the PDS label, which may contain items (such as comments, keywords, group and object delimiters) that are named differently than counterparts in the ODL and VICAR labels, or may omit some items altogether. Item differences are noted in Appendices A and E and omissions are concisely listed in Appendix G. Teams that update only one or two of the labels are responsible for removing the labels they do not update, to avoid confusion. Appendix C shows example ChemCam LIBS RDR labels.

The primary label supporting operations is the attached ODL label. ODL is the format used by PDS3 labels. Therefore, from a syntactic point of view, they look identical to PDS labels (with the exception of the initial keyword and other item omissions and/or name differences) and can be processed using most PDS tools. The difference is that the keywords are not validated and are not guaranteed to be in the PDS Data Dictionary. The reason for the ODL label is because the PDS standards approval process typically is out of phase with operations delivery schedules; keywords cannot be approved and appear in the Data Dictionary within the timeline needed in operations. Every attempt is made to keep the ODL and PDS keywords the same, but there are some discrepancies. The most common difference is that many PDS keywords have a “MSL:” prefix to indicate a local data dictionary, while the ODL keywords do not.

In the case of image EDR/RDR files only, a secondary operations label exists that is the attached VICAR label. This is used by MIPL/OPGS software to operate on the images. Again, the keywords for the most part match the ODL keywords; the difference is mostly formatting and syntax.

The primary label from the archive perspective is the detached PDS3 label. This is a separate file with the same base name as the image file, with a “.LBL” extension. The detached label references the EDR/RDR filename via a keyword. This label is fully compliant with all PDS archive standards.

### 3.2.2 PDS and ODL Labels

As implied in the previous section, EDRs and RDRs described in this document, with the exception of the OPGS Terrain RDR, have an attached ODL label and a detached PDS label. Each institution is responsible for converting PDS-formatted products to be compatible with their own software systems (such as VICAR, IDL, ISIS, etc.).

Because the PDS and ODL formats are identical, they are described together here, with differences in content noted as such.

Per PDS standards, the detached PDS label starts with the keyword assignment:

PDS\_VERSION\_ID = PDS3

The attached ODL label, which contains keywords that may not be compliant to PDS standards, starts with the keyword assignment:

ODL\_VERSION\_ID = ODL3

This is how the two label types are distinguished. With the exception of this keyword, any PDS-format reader that does not validate against the PDS Data Dictionary should be able to read the ODL labels.

A PDS/ODL label is object-oriented and describes the objects in the data file. The PDS/ODL label contains keywords for product identification, along with the data object definition containing descriptive information needed to interpret or process the data in the file. The PDS spreadsheet object is used to describe the format of the products.

PDS/ODL label statements have the form of "keyword = value". Each label statement is terminated with a carriage return character (ASCII 13) and a line feed character (ASCII 10) sequence to allow the label to be read by many operating systems. Pointer statements with the following format are used to indicate the location of data objects in the file:

`^object = location`

where the carat character (^, also called a pointer) is followed by the name of the specific data object. The location is the 1-based starting record number for the data object within the file. Alternatively, it could be the 1-based byte location within the file if it includes a <bytes> unit tag. The PDS detached label includes the filename as part of the pointer:

`^object = (filename, location)`

Pointers are used to define the locations of the binary instrument data itself (^IMAGE for image data), the VICAR header in the case of images (^IMAGE\_HEADER), and the ancillary binary data (ChemCam only, e.g. ^CCAM\_SOH\_DPO).

### **3.2.2.1 PDS Local Data Dictionary**

The PDS label contains many keywords with a "MSL:" prefix. These indicate keywords that are defined in the MSL local data dictionary, rather than the primary PDS data dictionary. The ODL label does not contain these prefixes.

### **3.2.2.2 Keyword Length Limits**

All PDS/ODL keywords are limited to 30 characters in length (Section 12.7.3 in PDS Standards Reference) [Ref 14], not including the "MSL:" prefix. Therefore, software that reads MSL PDS/ODL labels must be able to ingest keywords up to 30 characters in length.

For image RDR-producing institutions wishing to accommodate the VICAR mapping (see Section 3.2.2) of PDS/ODL keywords that use a <unit> tag after the value, such keywords must be limited to 24 characters in length. Otherwise, those keywords will not be transcoded from the PDS/ODL label into a VICAR label.

### 3.2.2.3 Data Type Restrictions

In order to accommodate VICAR dual-labeled files, 16-bit data must be stored as signed data. Unsigned 16-bit data are not supported. 12-bit unsigned data from the cameras are stored in a 16-bit signed value. 8-bit data are unsigned.

### 3.2.2.4 Interpretation of N/A, UNK, and NULL

During the completion of data product labels or catalog files, one or more values may not be available for some set of required data elements. In this case PDS provides the symbolic literals “N/A”, “UNK”, and “NULL”, each of which is appropriate under different circumstances. As a note, if any one of these three symbolic literals are used in place of a keyword value that is normally followed by a Unit Tag(s) (e.g., “<value>”), the Unit Tag(s) is removed from the label.

- “N/A” (“Not Applicable”) indicates that the values within the domain of this data element are not applicable in this instance. For example, a data set catalog file describing NAIF SPK kernels would contain the statement:

```
INSTRUMENT_ID = "N/A"
```

because this data set is not associated with a particular instrument.

“N/A” may be used as needed for data elements of any type (e.g., text, date, numeric, etc.).

- “UNK” (“Unknown”) indicates that the value for the data element is not known and never will be. For example, in a data set comprising a series of images, each taken with a different filter, one of the labels might contain the statement:

```
FILTER_NAME = "UNK"
```

if the observing log recording the filter name was lost or destroyed and the name of the filter is not otherwise recoverable.

“UNK” may be used as needed for data elements of any type.

- “NULL” is used to flag values that are *temporarily* unknown. It indicates that the data preparer recognizes that a specific value should be applied, but that the true value was not readily available. “NULL” is a placeholder. For example, the statement:

```
DATA_SET_RELEASE_DATE = "NULL"
```

might be used in a data set catalog file during the development and review process to indicate that the release date has not yet been determined.

“NULL” may be used as needed for data elements of any type.

Note that all “NULL” indicators should be replaced by their actual values prior to final archiving of the associated data.

### 3.2.2.5 PDS/ODL Label Constructs “Class”, “Object” and “Group”

The PDS has designed a set of formal and informal constructs for labeling data products. In the PDS realm, “formal” implies a standardized design or set of rules that provides a protocol across multiple data products (e.g., multiple flight missions) for PDS validation tools, and involves a rigorous approval

process. “Informal” implies a less rigorous process by which the construct meets PDS approval. For both formal and informal constructs, the PDS member keywords must be defined in the *Planetary Science Data Dictionary* (PSDD) [Ref 11] or the *Planetary Science Data MSL Local Dictionary* [Ref 12]. ODL label keywords need not be in the data dictionaries. For the EDRs and RDRs described in this document, the PDS/ODL label includes the following “formal” and “informal” constructs:

- *Class* - The Class construct is informal and resides in a PDS/ODL label as a grouping of keywords that are thematically tied together. Classes are usually preceded by a label comment, although it is not required. PDS/ODL label comments are character strings bounded by “/\* \*/” characters.

In the MSL Camera PDS/ODL label a Class of keywords will be preceded by a comment string as follows:

```
/* comment string */
keyword = keyword value
keyword = keyword value
```

- *Object* - The Object construct is formal and is a set of standard keywords used for a particular data product. In the PSDD, each Object definition lists the elements required to be present each time the Object is used in a product label. The PSDD also provides a list of additional, optional keywords that are frequently used in the Object. Any element defined in the PSDD may be included as an optional element in any Object definition, at the discretion of the data preparer.

In the MSL Camera PDS/ODL label an Object’s set of keywords is specified as follows:

```
OBJECT      = Object identifier
keyword     = keyword value
keyword     = keyword value
END_OBJECT = Object identifier
```

- *Group* - The Group construct can be either a formal or informal grouping of keywords that are not components of a larger Object. Group keywords may reside in more than one Group within the label.

The Group construct is further described in section 12.4.5 of the PDS Standards Reference, "Object Description Language Specification and Usage: GROUP Statement".

In the MSL Camera PDS/ODL label, a Group’s set of keywords is specified as follows:

```
GROUP      = Group identifier
keyword    = keyword value
keyword    = keyword value
END_GROUP = Group identifier
```

### 3.2.2.6 PDS/ODL Image Object

An IMAGE object is a two-dimensional array of values, all of the same type, each of which is referred to as a *sample*. IMAGE objects are normally processed with special display tools to produce a visual representation of the samples by assigning brightness levels or display colors to the values. An IMAGE consists of a series of lines, each containing the same number of samples.

The required IMAGE keywords define the parameters for simple IMAGE objects:

- LINES is the number of lines in the image.
- LINE\_SAMPLES is the number of samples in each line.
- SAMPLE\_BITS is the number of bits in each individual sample.
- SAMPLE\_TYPE defines the sample data type.

The IMAGE object has a number of keywords relating to image statistics. These keywords will be present in all EDRs. In RDRs, they are optional, and if they are present, they must be updated to reflect the current statistics of the image (often they will be omitted for the sake of computational efficiency). Note that the VICAR label never contains these keywords; see section 3.2.2. The statistics keywords are:

- MEAN
- MEDIAN
- MAXIMUM
- MINIMUM
- STANDARD\_DEVIATION
- CHECKSUM

Many variations on the basic IMAGE object are possible with the addition of optional keywords and/or objects. The “^IMAGE” keyword identifies the start of the image. Recommended image formats are described and illustrated in Reference 4, Appendix A.19.

### 3.2.2.7 PDS/ODL Table Objects and “.FMT” Files

In lieu of the binary Image Data Product Header (IDPH) Data Product Object (DPO) contained in the Engineering Camera and MMM EDR products, ChemCam EDRs include binary DPOs that contain ancillary information about the EDR. Of these, the primary carrier of such information is the Ancillary DPO. Refer to Figure 4.4 (Diagrams B and C) for a visual schematic of the ChemCam EDR structures, wherein the DPO information is noted as “auxiliary” data. Some of the data from these DPOs are pulled out into standard PDS/ODL label items. Section 4.4.2 discusses the ChemCam EDR structure and how the DPOs reside within the EDR.

The ^pointer at the beginning of the label points to the data itself. There is also a PDS/ODL Object in the label, which defines the contents and structure of the data. How the structure is described is defined by the PDS standards documents [Ref 14], so it is not fully defined here.

Of particular note is that most of the structure is offloaded to a separate format (.FMT) file via a ^STRUCTURE keyword within the object. The various “.FMT” files supporting the ChemCam EDR labels are described explicitly in Appendix D.

An example of the label object is shown below:

```

OBJECT          = TABLE
NAME            = "CCAM_SOH_DPO_TABLE"
COLUMNS         = 20
ROWS            = 80
ROW_BYTES       = 46
INTERCHANGE_FORMAT = "BINARY"
DESCRIPTION      = "ChemCam State of Health Structure"

/* This format file defines columns 1-43, the first part of the SCIDATA object. */

^STRUCTURE      = "CCAM_SOH_DPO_TABLE.FMT"

/* This container includes columns 44, 45, and 46. This set of columns may
/* be repeated up to 20 occurrences. */

OBJECT          = CONTAINER
NAME            = "CCAM_SOH_TO_RCE_CONTAINER"
START_BYTE      = 129
BYTES           = 100
REPETITIONS     = 20 /* or any number between 1 and 20 */
DESCRIPTION      = "ChemCam SOH to RCE structure.
Includes arrays ccam_DPU_SOH_struct and ccam_MU_SOH_struct."
                                         */

/* This format file defines columns 44, 45, and 46, the last part
/* of the SCIDATA object. */

^STRUCTURE      = "CCAM_SOH_TO_RCE_CONTAINER.FMT"

END_OBJECT      = CONTAINER
END_OBJECT      = TABLE

```

### 3.2.3 VICAR Label

For all image EDR data products and MIPL produced image RDR data products, an embedded VICAR label follows the ODL label and is pointed to by the PDS/ODL pointer "`^IMAGE_HEADER`". The VICAR label is also organized in an ASCII, "keyword = value" format, although there are only spaces between keywords (no carriage return/line feeds as in PDS). The information in the VICAR label is an exact copy of the information in the PDS label as defined in the next section. The reader is referred to the VICAR File Format document for details of the format, which is available at the URL "[http://www-mipl.jpl.nasa.gov/external/VICAR\\_file\\_fmt.pdf](http://www-mipl.jpl.nasa.gov/external/VICAR_file_fmt.pdf)". The following text is an excerpt which describes the basic structure:

A VICAR file consists of two major parts: the labels, which describe what the file is, and the image area, which contains the actual image. The labels are potentially split into two parts, one at the beginning of the file, and one at the end. Normally, only the labels at the front of the file will be present. However, if the EOL keyword in the system label (described below) is equal to 1, then the EOL labels (End Of file Labels) are present. This happens if the labels expand beyond the space allocated for them. The VICAR file is treated as a series of fixed-length records, of size RECSIZE (see

below). The image area always starts at a record boundary, so there may be unused space at the end of the label, before the actual image data starts.

The label consists of a sequence of "keyword=value" pairs that describe the image, and is made up entirely of ASCII characters. Each keyword-value pair is separated by spaces. Keywords are strings, up to 32 characters in length, and consist of uppercase characters, underscores ("\_"), and numbers (but should start with a letter). Values may be integer, real, or strings, and may be multiple enclosed in parentheses (e.g. an array of 5 integers, but types cannot be mixed in a single value). Spaces may appear on either side of the equals character (=), but are not normally present. The first keyword is always LBLSIZE, which specifies the size of the label area in bytes. LBLSIZE is always a multiple of RECSIZE, even if the labels don't fill up the record. If the labels end before LBLSIZE is reached (the normal case), then a 0 byte terminates the label string. If the labels are exactly LBLSIZE bytes long, a null terminator is not necessarily present. The size of the label string is determined by the occurrence of the first 0 byte, or LBLSIZE bytes, whichever is smaller. If the system keyword EOL has the value 1, then End-Of-file Labels exist at the end of the image area (see above). The EOL labels, if present, start with another LBLSIZE keyword, which is treated exactly the same as the main LBLSIZE keyword. The length of the EOL labels is the smaller of the length to the first 0 byte or the EOL's LBLSIZE. Note that the main LBLSIZE does not include the size of the EOL labels. In order to read in the full label string, simply read in the EOL labels, strip off the LBLSIZE keyword, and append the rest to the end of the main label string.

Note that the EOL labels will not appear in archive products.

A binary header may appear in between the VICAR label and the image, containing arbitrary binary data that are not interpreted by VICAR. The number of records in this header is defined by the VICAR system keyword NLB. This binary header area is where the ChemCam DPOs are stored.

### 3.2.4 Mapping of PDS/ODL and VICAR Labels

In the cases of the attached ODL and VICAR labels, information content is identical, by definition. ODL and VICAR labels may be used interchangeably, for any purpose in the mission. Any software that modifies one label must also modify the other, or remove them entirely. This is often most easily accomplished by stripping off one of the headers, processing the remaining label as desired locally, and then running a conversion tool to re-create the missing header. Such tools will be provided by MIPL.

In the case of the detached PDS label, information content is not necessarily identical to the ODL label, and therefore not necessarily identical to the VICAR label when applicable. It is intended that a PDS label can have reduced content, but not increased content, in comparison to the ODL and VICAR labels. Appendix G tracks the label keywords that are not present in the PDS label.

It is important to note that only product labels containing the label keyword assignment "PDS\_VERSION\_ID = PDS3" are valid PDS products.

The mapping between PDS and ODL keywords is straightforward, and keyword names are usually the same. However, there are some keyword name differences. Appendix A shows a label in ODL format, and identifies differences in ODL and PDS keyword names. For space reasons in this document, the corresponding VICAR label is omitted from this document, but it is required. The mapping rules are as follows:

- For mapped PDS, ODL and VICAR (if applicable) keywords, values are identical in all cases with the exception of differences mandated by the file format itself, such as quoting rules. See the respective PDS and VICAR documents for details, but in general, PDS/ODL uses double quotes ("") while VICAR uses single quotes ('').
- For ODL and VICAR label keywords, with the exception of those defining the file format itself (described below), names are identical in both cases.
- For PDS labels, resident keywords map 1-to-1 with ODL keywords, but not all ODL keywords have a mapping to PDS keywords. ODL keywords not represented in PDS labels are listed in Appendix G.
- For PDS labels, keyword names are usually identical to keywords in the ODL label, but not necessarily so. Name differences between keywords are identified in Appendix A.
- Any ODL label group maps 1-to-1 to a VICAR property set with the same name (Group) name == property set name). All contained keywords are identical in both cases. The GROUP and END-GROUP keywords are omitted from the VICAR label; PROPERTY keywords are used instead (as per the VICAR file format definition).
- For PDS labels, groups map 1-to-1 with the ODL label, but group names can differ. Name differences between groups are identified in Appendix A.
- Any set of PDS/ODL keywords not in a group (in PDS terms, a class) is identified by an introductory comment (e.g. /\* IDENTIFICATION DATA ELEMENTS \*/). Such classes map 1-to-1 to a VICAR property set. The name of the VICAR property set and the name of the PDS introductory comment map as follows:

**Table 3.2.4.1 – PDS/ODL Class to VICAR Property Set Mappings**

PDS/ODL Class Comment	VICAR Property Set Name
/* FILE DATA ELEMENTS */	special case, see below
/* POINTERS TO DATA OBJECTS */	special case, see below
/* IDENTIFICATION DATA ELEMENTS */	IDENTIFICATION
/* TELEMETRY DATA ELEMENTS */	TELEMETRY
/* HISTORY DATA ELEMENTS */	PDS_HISTORY_PARMS
/* COMPRESSION RESULTS */	COMPRESSION_PARMS

- For VICAR labels, PDS/ODL comments (i.e., /\* *string* \*/) are stored in a keyword named "PDS\_COMMENT". This keyword appears in the VICAR property containing the elements immediately following the comment. When converting from VICAR to PDS/ODL, the comment is placed immediately before the group or class. Blank lines should surround the comment. Note that with OPGS-generated EDR and RDR data products, multiple comment lines in a Group are not supported.
- The PDS/ODL objects IMAGE\_HEADER and IMAGE, as well as the keywords in /\* FILE DATA ELEMENTS \*/ and the ^IMAGE and ^IMAGE\_HEADER pointers (in /\* POINTERS TO DATA OBJECTS \*/) in the table above, do not map directly to VICAR. They all describe the layout of the file and the image data. The VICAR equivalent for all of these items is the

VICAR System label. Information maps between these in a straightforward way. It should be trivial to construct a VICAR system label and the above-referenced PDS entities after referring to the respective file-format-definition documents. Note that the /\* FILE DATA ELEMENTS \*/ and /\* POINTERS TO DATA OBJECTS \*/ comments are constant and so are not mapped to PDS\_COMMENT keywords in the VICAR label. They are inserted automatically as part of the system label conversion process.

- The statistics-related keywords in the PDS/ODL IMAGE object are MEAN, MEDIAN, MAXIMUM, MINIMUM, STANDARD\_DEVIATION, and CHECKSUM. These keywords are never transferred to the VICAR label. For VICAR -> PDS/ODL conversion, they can be computed from the image, or simply omitted from the PDS/ODL image (for RDRs only - EDRs require them).
- A few remaining items in the PDS/ODL\_IMAGE object are treated specially. The FIRST\_LINE, FIRST\_LINE\_SAMPLE, INVALID\_CONSTANT, and MISSING\_CONSTANT keywords are transferred to the VICAR IMAGE\_DATA property set.
- Any PDS/ODL keyword with a <unit> tag after the value is transferred to the VICAR label without the unit tag. A VICAR keyword with the same name, but with "\_\_UNIT" (two underscores) appended to the end, is added with the value of the unit. So for example, the PDS/ODL keyword "EXPOSURE\_TIME = 1.5 <s>" would translate to two VICAR keywords: "EXPOSURE\_TIME = 1.5" and "EXPOSURE\_TIME\_\_UNIT = s". Note that because of this, any PDS/ODL keyword that can support a unit is limited to 24 characters. If there is more than one value (an array), a unit is associated with each. In this case, the "\_\_UNIT" VICAR keyword becomes multi-valued also, with each unit copied in sequence. If one of the elements does not have a unit (but others do), the corresponding entry is "N/A" (which is not copied to the PDS/ODL label). So for example, PDS/ODL "CONTRIVED\_ANGLE = (1.2 <rad>, 22.0, 54.1 <deg>)" would map to VICAR "CONTRIVED\_ANGLE = (1.2, 22.0, 54.1)" and "CONTRIVED\_ANGLE\_\_UNIT = (rad, N/A, deg)".
- The VICAR history label is omitted from the PDS header
- PDS/ODL TABLE objects (used to describe the ChemCam DPOs) map to VICAR property sets with each table, or container within the table (subobject), being a separate property set. The name of the property set matches the name of the table object (OBJECT = name). Certain keywords are handled specially, as described in the following table:

**Table 3.2.4.2 – Referencing PDS/ODL Objects in VICAR Label**

VICAR Label	PDS / ODL Meaning
PDS_OBJECT_TYPE=TABLE	Type of PDS/ODL object.
PDS_OBJECT_PTR=recnum	^pointer = (recnum + pointer to header area)
PDS_OBJECT_OFFSET=offset	Byte offset within record for pointer, if needed.
PDS_OBJECT_LOC=BINARY HEADER	Tells where the object is for proper PTR adjustment.
PDS_OBJECT_CHILD=(xxx,yyy)	Names of subobjects (PDS/ODL containers).
PDS_OBJECT_PARENT=aaa	Name of parent object.

Note: PDS\_OBJECT\_PTR is a 1-based record number within the binary header, so it must be adjusted to be relative to the start of the file for the ODS/ODL pointer.

- PDS/ODL ^pointer objects other than ^IMAGE and ^IMAGE\_HEADER that point to tables or containers map to PDS\_OBJECT\_\* keywords as described in the table above. Any remaining pointers, such as ^STRUCTURE, map to VICAR by removing the leading caret and appending “\_\_PTR”. Thus “^STRUCTURE” becomes “STRUCTURE\_\_PTR” in VICAR.

## 3.3 Binary Data Storage Conventions

EDR and RDR data products for MSL camera image and LIBS spectra data are stored as binary data. For the image EDRs, the data formats include rescaled 8-bit integers stored in an unsigned byte, as well as 10-bit or 12-bit integers stored in signed 16-bit integers. The spectrum EDR cases vary between unsigned 16-bit and unsigned 32-bit integers. The PDS and VICAR labels are stored as ASCII text.

### 3.3.1 Bit and Byte Ordering

The ordering of bits and bytes is only significant for instrument (image and spectra) and binary header data; all other labeling information is in ASCII.

For non-byte instrument data, which includes 8-bit unsigned shorts, 16-bit signed shorts, 32-bit signed ints, and 32- and 64-bit IEEE floating-point numbers, the data may be stored in either Most Significant Byte first (“big-endian”, as used by e.g. Sun computers and Java), or Least Significant Byte first (“little-endian”, as used by e.g. Linux and Windows computers). In a EDR/RDR product, the instrument data can have only one ordering, but it is dependent on the host platform where the data was processed. Binary header data, applicable to ChemCam, can have a different ordering than the instrument data. This follows both the PDS/ODL and VICAR file format conventions.

For Engineering Camera and MMM image data, the PDS/ODL label carries keyword SAMPLE\_TYPE in the IMAGE Object to define which ordering is used in the file. The VICAR label carries keywords INTFMT and REALFMT in the System portion of the label to define the ordering. Both of these file formats specify that bit 0 is the least significant bit of a byte. See the respective PDS and VICAR file format definition documents.

For ChemCam instrument data, RMI image data ordering is defined by keyword SAMPLE\_TYPE in the IMAGE Object of the PDS/ODL label and by keywords INTFMT and REALFMT in the System portion of the VICAR label. LIBS spectra data ordering is defined by pointer STRUCTURE in the CCAM\_LIBS\_TABLE Object of the PDS/ODL label. ChemCam binary headers are of varying data type, as described in their PDS/ODL label Object definitions and the external “.FMT” files. However, they are always in MSB (“big-endian”) format, even if the instrument data are LSB.

**Table 3.3.1 - MSL Image EDR/RDR and Spectrum EDR Bit Ordering**

Address	MSB-first	LSB-first
n	most significant byte	least significant byte
n+1	next	next
n+2	next	next
n+3	least significant byte	most significant byte

## 4. EDR PRODUCT SPECIFICATION

MSL instrument EDRs and RDRs described in this document will be generated by JPL's Multimission Instrument Processing Laboratory (MIPL) under the OPGS subsystem of the MSL GDS Realtime Operations (RTO) element. Other RDRs described in this document will be generated by the ChemCam Science Team.

The EDR consists of unprocessed experiment data stored in binary format. The EDR structures defined in this document vary depending on instrument, with all containing attached metadata labels.

For MSL, with the exception noted in Section 1.3, the camera image EDR and LIBS spectrum EDR are the fundamental instrument data archive product. They will be generated as "raw" uncalibrated data within an automated pipeline process managed by MIPL under OPGS at JPL. The size of an image EDR data product is approximately 2 MB, while the size of a spectrum EDR is approximately 260 KB. The total estimated volume of image EDRs and spectrum EDRs over the course of the nominal 2-year MSL mission is approximately 376 Gigabytes and 6 Gigabytes, respectively.

### 4.1 EDR General Processing

The EDR processing begins with the reconstruction of packetized telemetry data resident on the TDS by the Mission data Processing and Control Subsystem (MPCS) into a binary ".dat" data product and associated ".emd" Earth meta-data file. The data product and meta-data are written by MPCS to the Operations Data Store (ODS) and messages are generated on a Java Message Server (JMS) bus, where they are ingested by MIPL's EDR generator "msledrgen" and processed with SPICE kernels provided by NAIF. The EDR will be generated within 60 seconds after the JMS message describing the ODS location of the respective the binary data product and associated Earth meta-data file has been received by the OPGS pipeline system. This data flow is illustrated in Figure 4.1, and is elaborated subsequently in this section:

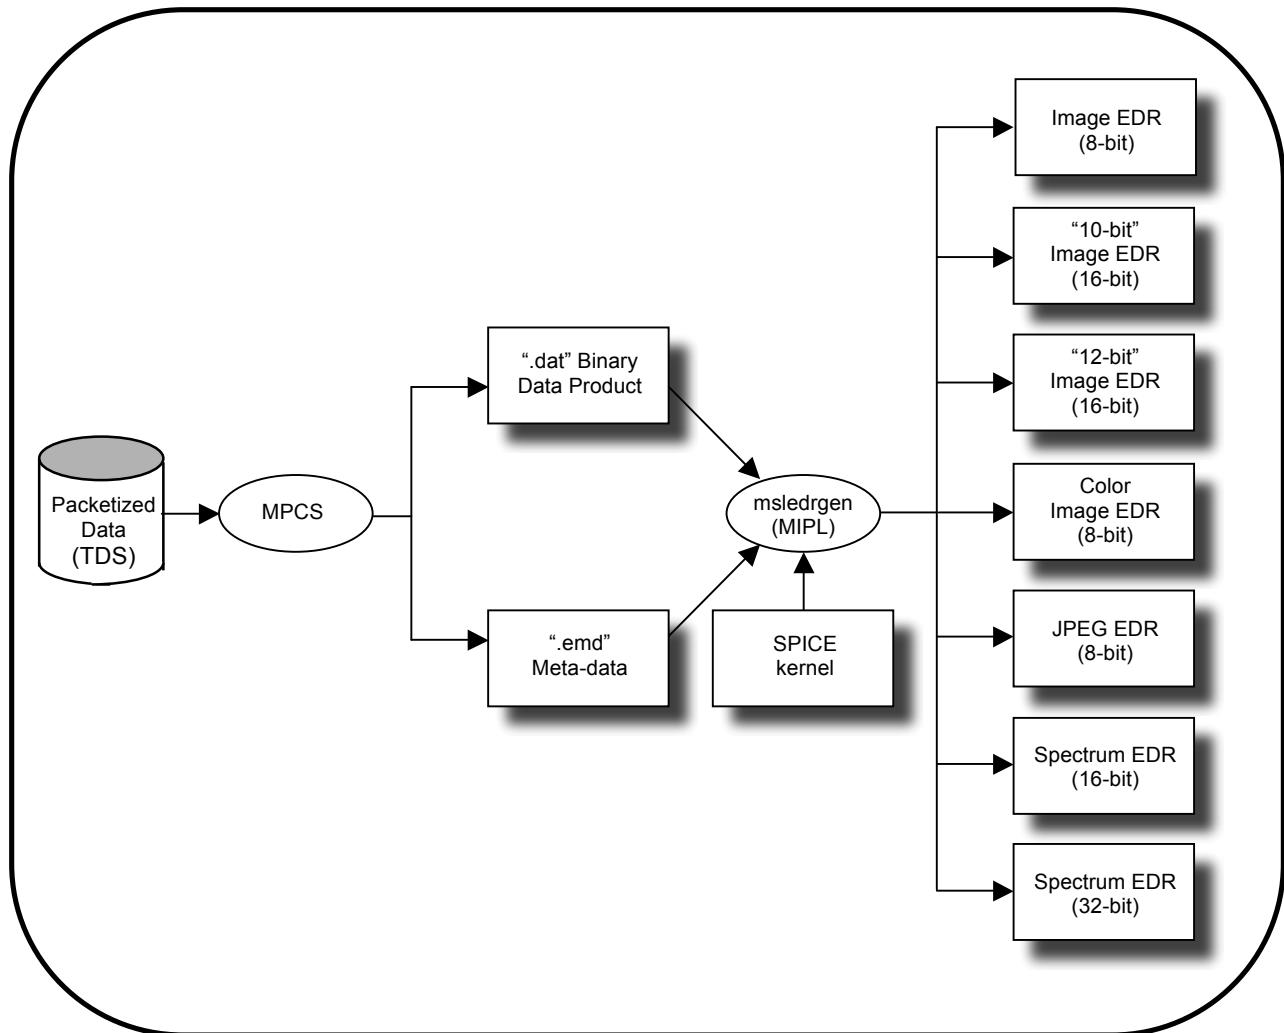

Figure 4.1 - EDR Processing Flow

In all EDR cases, missing packets will be identified and reported for retransmission to the ground as “partial datasets”. Prior to retransmission, the missing EDR data will be filled with zeros. The EDR data will be reprocessed only after all “partial datasets” are retransmitted and received on the ground. In these cases, the EDR version will be incremented so as not to overwrite any previous EDR versions. The EDR data product will be placed into FEI for distribution and to facilitate the archiving process.

## 4.2 EDR Product Types

Descriptions for the various EDR product types are provided in this section. They are broken down into four groupings: a) Image, b) Image Support, c) Spectroscopy, and d) Health & Safety. Refer also to Table 4.3 for a mapping between the source MSL instrument and the EDR product type.

### 4.2.1 Image EDRs

#### 4.2.1.1 Standard Image EDR

All of the imaging instruments create standard image EDRs (for engineering camera and RMI, this is the only image EDR type). These images are uncompressed, raster-format data products. They are nominally 12-bit products, stored as 16-bit signed integers. If 12-to-8 bit scaling (called "companding" by the MMM instruments) is performed onboard, then pixels are stored as 8-bit unsigned bytes. Engineering camera and RMI images are always a single band. MMM EDRs may consist of one or three bands, depending on whether color processing was done onboard.

#### 4.2.1.2 MMM-specific Image EDR

For MMM, there is a Bayer pattern of R,G,B filters superimposed on the CCD. This may be processed onboard to create a color image. If this is done, the data will always be sent as 3-band, 8-bit JPEG color, and the EDR will be 3-band byte format. The MMM cameras can also send data without color processing, in which case it will either be a single-band 8-bit JPEG, or a 8- or 12-bit uncompressed or losslessly-compressed image, stored as described above. In any case, if a JPEG is sent, a JPEG EDR will also be created.

##### 4.2.1.2.1 MMM “JPEG” EDR

The MMM instruments often compress their images using JPEG for downlink. The JPEG EDR contains this JPEG as originally downlinked; it has not been uncompressed or recompressed. This type is not produced unless JPEG compression used onboard (i.e. no ground compression). It may be a color or grayscale (single band) JPEG.

##### 4.2.1.2.2 MMM “Z-stack” EDR

The MAHLI (most typically) and Mastcam instruments may create a Z-stack image onboard, by combining images taken at different focus settings. The result is a best-focus image with a much greater depth of field. Each pixel contains data from the source image(s) that are in best focus (potentially interpolated between neighboring images). This image may be color or a single band.

**NOTE:** The metadata regarding vehicle state for Z-stack images reflects the state of the vehicle at the time the Z-stack product itself was created. This is generally not the same as the vehicle state at the time the imagery was acquired. Most importantly, this means the arm state and mast state, and thus camera model, for these images do not properly describe the image. The metadata must be obtained from the thumbnail or full frame of one of the images that went into making the Z-stack. Determining the proper image to use is beyond the scope of this document, but can often be inferred by inspection of the available data.

##### 4.2.1.2.3 MMM “Depth Map” EDR

As part of MMM Z-stack processing, a Depth Map image may also be produced. This 8-bit, single-band EDR indicates which image the best-focus data came from. Pixels with a digital number (DN) of 0 indicate the first image in the Z-stack, while a DN of 255 indicates the last, with linear scaling between. For example, with a 5-image stack and expected DNs of 0, 64, 128, 192, and 255, a DN of

96 would indicate the depth is halfway between images 2 and 3.

NOTE: The metadata regarding vehicle state for Depth Map images reflects the state of the vehicle at the time the Depth Map product itself was created. This is generally not the same as the vehicle state at the time the imagery was acquired. Most importantly, this means the arm state and mast state, and thus camera model, for these images do not properly describe the image. The metadata must be obtained from the thumbnail or full frame of one of the images that went into making the Depth Map. Determining the proper image to use is beyond the scope of this document, but can often be inferred by inspection of the available data.

#### **4.2.1.2.4 MMM “Video” EDR**

The MMM Video EDR is identical in format to the standard image EDR. It represents a single frame of a video sequence. The EDR type is separate in order to better distinguish video frames from still frames.

#### **4.2.1.2.5 MMM “Recovered” EDR**

An MMM Recovered EDR is an EDR for which the metadata is unavailable. It existed in camera memory but for whatever reason the onboard data product describing it was lost or deleted. Such products have extremely limited metadata, with lots of "UNK" (unknown) values. This can occur to any MMM EDR type.

### **4.2.1.3 Image Sampling Types**

Except where otherwise noted, in general, the image types described above can be sent in one of three pixel sampling types: 1) Full-frame, 2) Subframe, or 3) Downsampled. They may also be sent as a Thumbnail, in addition to (or instead of) the three aforementioned formats.

#### **4.2.1.3.1 “Full Frame” EDR**

Full-frame EDRs contain the entire contents of the CCD. For the engineering cameras and RMI, this means a 1024x1024 image. For MMM instruments, this means 1648 (columns) x 1200 (rows).

#### **4.2.1.3.2 “Subframe” EDR**

Sub-frame EDRs are a subset of rows and columns of the full-frame image. They can be thought of as a window on the CCD, with the same resolution but smaller coverage area.

#### **4.2.1.3.3 “Downsampled” EDR**

Downsampled EDRs contain a smaller version of the image, resulting in reduced resolution of the same coverage area. They apply to engineering camera and RMI camera images, but not to MMM camera images. Downsampling can be done via one of three methods: 1) nearest neighbor pixel averaging, 2) pixel averaging with outlier rejection, or 3) computing the median pixel value. Note that downsampling can be applied to subframes, although this is not normally done.

#### **4.2.1.3.4 “Thumbnail” EDR**

Thumbnails are a reduced-resolution version of the original image, sent in addition to, or instead of, the original image. They apply to all image EDRs. The main purpose of a Thumbnail EDR is to provide an image summary using a very low data volume compared to the original image. Decisions about downlinking the original image can be made using the Thumbnail. For the engineering cameras and RMI, Thumbnails are produced relative to the full-frame image, even if the product is downsampled or subframed. For MMM camera images, Thumbnails are of the subframe region only, and not the full-frame.

## 4.2.2 Image Support EDRs

### 4.2.2.1 “Row Summation” EDR

A row summation EDR is the summing of the rows of a full-frame or subframed image and returning the results. The EDR is a  $nx1$  array of 32-bit integers (whose length is equal to the image height) where the DN value of the  $i$ th element is the value of the sum of all the pixels in the  $i$ th row. Applicable to the Engineering Camera instrument suite.

### 4.2.2.2 “Column Summation” EDR

A column summation EDR is the summing of the columns of a full-frame or sub-framed image and returning the results. The EDR is a  $1xn$  array of 32-bit integers (whose length is equal to the image width) where the DN value of the  $i$ th element is the value of the sum of all the pixels in the  $i$ th column. Applicable to the Engineering Camera instrument suite.

### 4.2.2.3 “Reference Pixel” EDR

The onboard CCD array has “Reference” dark pixels (12-bits) located before and after the image data. For the Eng. Cameras, there are 16 “pre-Reference” and 15 “post-Reference” pixels followed by the camera hardware serial number (left-shifted by 4 bits if 12-bit data) in each row. For the ChemCam RMI, there are 12 “pre-Reference” lines before the image lines and 12 “post-Reference” lines after the image lines. Also, there are 16 “pre-Reference” pixels before the image data in each row. Applicable to the Engineering Camera instrument suite and ChemCam RMI.

### 4.2.2.4 “Histogram” EDR

The histogram EDR is a 32-bit integer array storing the histogram of the image. A  $1x256$  or  $1x4096$  array will be returned. Applicable to the Engineering Camera instrument suite.

## 4.2.3 Spectroscopy EDRs

### 4.2.3.1 “Spectrum” EDR

The spectrum EDR is comprised of one or more ChemCam LIBS spectroscopy intensity (spectra) values, or digital numbers (DNs), stored as an array of 16-bit or 32-bit unsigned integers. The data range is dependent on which of the three possible spectrometers (UV, Visible, Near-infrared) were commanded. Applicable to the ChemCam LIBS instrument.

## 4.2.4 Engineering EDRs

### 4.2.4.1 “State-of-Health” (SOH) EDR

The SOH EDR is comprised of binary metadata describing the health and safety of ChemCam instrumentation. There are five variants: a) State-of-Health, b) Power On, c) Power Off, d) Sun Safe and e) Initialize. Stored in 16-bit unsigned integer format, they are a vector of 9 entities for the ChemCam Body Unit and a vector of 39 entities for the ChemCam Mast Unit. Applicable to the ChemCam instrument suite as a standalone product.

#### 4.2.4.2 “NavMap” EDR

The NavMap products are engineering products used to assess the performance of the rover's on-board navigation software. All 3-char product identifiers starting with “N” (form: Nxx) are NavMap products.

The list of NavMap products and their short descriptions are provided in Table 4.3. Most, but not all, are images of some sort in the standard VICAR/ODL/PDS format with varying data types, sizes, and numbers of bands. Because these are detailed engineering products, no further description of them is provided in this document. They will not be archived.

### 4.3 EDR Product Format

Description of EDR product formats in this section will be by instrument suite: a) Engineering Cameras, b) ChemCam Instruments, c) MMM Instruments.

The EDR will be formatted according to this SIS, following the general terms of labeling and bit ordering previously discussed in Sections 3.2 and 3.3, respectively. This section details the specifics of a variety of formats across all image EDRs and spectrum EDRs. The various EDR formats and their data sizes, across all instrument suites, are listed in Table 4.3 and discussed subsequently in this section:

**Table 4.3 – List of EDR Types and Formats**

Type	Product Identifier	Size	Format (bits)	Instruments	Description
Standard Image	EDR	<u>Full-frame</u> <ul style="list-style-type: none"> <li>• 1024 lines x 1024 samples for Eng. Cams</li> <li>• 1024 lines x 1024 samples without Ref Pixels (1056 lines x 1072 samples with Ref Pixels) for RMI</li> <li>• Up to 1200 lines x 1648 samples for MMM Cams</li> </ul>	8-bit unsigned or 16-bit signed integer	Eng. Cams, RMI, MMM Cams	Nominal full sized, full resolution data product. Nominally, data are acquired at 10-bit (RMI) or 12-bit (Eng. Cams) resolution, stored as the last 12 bits of a 16-bit integer. If “12 to 8-bit” scaling was commanded (Eng. Cams), the 12-bit data has been scaled onboard as 8-bit pixels, stored on the ground in a single unsigned byte. Note that as an RDR, these scaled 8-bit data can be unscaled back to 12 bits, using an Inverse Lookup Table (ILUT), stored as the last 12 bits of a 16-bit integer.
		<u>Subframe</u> Variable size	8-bit unsigned or 16-bit signed integer	Eng. Cams, RMI, MMM Cams	Same format as Full Frame, but only a selected row (line) and/or column sub-frame is read back. ICER is also capable of subframing. The bit scaling rules described for the Full Frame case above also apply here.

Type	Product Identifier	Size	Format (bits)	Instruments	Description
		<u>Downsampled</u> Variable size (usually 1/4 size of Full Frame)	8-bit unsigned or 16-bit signed integer	Eng. Cams, MMM Cams	<p>Images are converted to smaller images via a) nearest neighbor pixel averaging, b) pixel averaging with outlier rejection, or c) computing the median pixel value.</p> <p>The bit scaling rules described for the Full Frame case above also apply here.</p>
		<u>Thumbnail</u> <ul style="list-style-type: none"> <li>• 64 lines x 64 samples for Eng. Cameras, nominally</li> <li>• 64 lines x 64 samples for RMI, nominally</li> <li>• Variable size for MMM Cameras</li> </ul>	8-bit unsigned or 16-bit signed integer	Eng. Cams, RMI, MMM Cams	<p>This data product is a spatially sized down version of an existing Full Frame, so is less than full size and less than full resolution.</p> <p>The bit scaling rules described for the Full Frame case above also apply here.</p>
MMM-specific Image	EJP	<u>JPEG</u> Variable size	8-bit unsigned	MMM Cameras	Contains JPEG-compressed data as originally downlinked. It may be a color or grayscale (single band) JPEG.
	EZS	<u>Z-stack</u> Variable size	8-bit unsigned	MMM Cameras	A best-focus Z-stack image, from a combination of images at different focus settings, with a much greater depth of field. Typically MAHLI data. It may be color or a single band.
	EDM	<u>Depth Map</u> Variable size	8-bit unsigned	MMM Cameras	Part of MMM Z-stack processing. This single-band image indicates which image the best-focus data came from. DN of 0 indicates first image in the Z-stack, 255 is the last, with linear scaling between.
	EVD	<u>Video</u> Variable size	8-bit unsigned	MMM Cameras	Identical in format to the Standard image EDR. It represents a single frame of a video sequence.
Image Support	ERS	<u>Row Summed</u> N lines x 1 sample	32-bit unsigned	Eng. Cams	Array of 32-bit integers whose length is equal to image height, wherein the DN value for the Jth element equals the sum of all pixels in the Jth row.
	ECS	<u>Column Summed</u> 1 line x N samples	32-bit unsigned	Eng. Cams	Array of 32-bit integers whose length is equal to image width, wherein the DN value for the Jth element equals the sum of all pixels in the Jth column.
	ERP	<u>Reference Pixel</u> <ul style="list-style-type: none"> <li>• 1024 lines x 32 (16 “pre”, 16 “post”) samples for Eng. Cameras</li> <li>• 1024 lines x 16 “pre” samples, plus</li> </ul>	16-bit unsigned	Eng. Cams, RMI	Dark pixels bookending (pre- and post-) image pixels during serial register readout. There are “pre-” Reference and “post-” Reference pixels, and in the case of Eng. Cameras, an additional 1 for the camera

Type	Product Identifier	Size	Format (bits)	Instruments	Description
		12 "pre" lines and "post" lines, for RMI			hardware serial number (left-shifted by 4 bits if 12-bit data).
	EHG	<u>Histogram</u> • 1 line x 4096 samples • 1 line x 256 samples	32-bit unsigned	Eng. Cams	DN histogram computed from image can have either 256 or 4096 bins, each capable of holding count values of up to 4,194,304.
	EID	<u>IDPH-only</u> 1 line x 1 sample	8-bit unsigned or 16-bit signed integer	Eng. Cams	IDPH (Image Data Product Header) only, with no image data. The data is formatted as a 1x1 image with a 0 pixel value. This product is generated when the cameras are commanded to acquire a picture (for example, to pre-point the RSM), but no image data are requested from the camera. These types of products are intended to serve as metadata only and are typically used to identify RSM pre-point activities.
Spectroscopy	EDR	variable	16-bit or 32-bit unsigned	LIBS	Array of spectrum intensity values stored in 16-bit or 32-bit data ranges, depending on commanded mode of ChemCam LIBS spectrometers.
State-of-Health	EDR	variable	16-bit unsigned	RMI, LIBS	Binary metadata fields stored in 16-bit integer. For ChemCam Body Unit, vector of 9 entities. For ChemCam Mast Unit, vector of 39 entities.
Navigation Map	NGD	n/a	n/a	Eng. Cameras	Nav Map Goodness – measure of how safe rover would be, centered at each cell
	NCE	n/a	n/a	Eng. Cameras	Nav Map Certainty – measure of how certain the Goodness map values are
	NID	n/a	n/a	Eng. Cameras	Nav Map Idles – number of steps since a cell was updated
	NMN	n/a	n/a	Eng. Cameras	Nav Map Minimum Count – measure of how often this cell was Minimum elevation
	NMX	n/a	n/a	Eng. Cameras	Nav Map Maximum Count – measure of how often this cell was Maximum elevation
	NEL	n/a	n/a	Eng. Cameras	Nav Map Elevation – cell elevation
	NNX	n/a	n/a	Eng. Cameras	Nav Map Normal X – X component of surface normal at cell
	NNY	n/a	n/a	Eng. Cameras	Nav Map Normal Y – Y component of surface normal at cell
	NNZ	n/a	n/a	Eng. Cameras	Nav Map Normal Z – Z component of surface normal at cell

Type	Product Identifier	Size	Format (bits)	Instruments	Description
	NTL	n/a	n/a	Eng. Cameras	Nav Map Tilt – tilt at this cell
	NRS	n/a	n/a	Eng. Cameras	Nav Map Residual – plane fit residual centered at this cell
	NOF	n/a	n/a	Eng. Cameras	Nav Map Offset – plane equation term
	NMO	n/a	n/a	Eng. Cameras	Nav Map Moments – First, Second order moments of stereo points in this cell
	NFP	n/a	n/a	Eng. Cameras	Nav Map Footprint – moment footprint
	NRK	n/a	n/a	Eng. Cameras	Nav Map Rock – find a Rock map
	NMC	n/a	n/a	Eng. Cameras	Nav Map Minimum Cells – <i>to be determined</i>
	NFV	n/a	n/a	Eng. Cameras	Nav Map FOV – <i>to be determined</i>
	NFE	n/a	n/a	Eng. Cameras	Nav Map FOV Edge – <i>to be determined</i>
	NPI	n/a	n/a	Eng. Cameras	Nav Map Path Information – binary path evaluations
	NLY	n/a	n/a	Eng. Cameras	Nav Map Layer Certainty – certainty of Layer data
	NED	n/a	n/a	Eng. Cameras	Nav Map Elevation Difference – elevation difference
	NL0	n/a	n/a	Eng. Cameras	Nav Map Layer 0 – Layer 0 goodness map
	NL1	n/a	n/a	Eng. Cameras	Nav Map Layer 1 – Layer 1 goodness map
	NL2	n/a	n/a	Eng. Cameras	Nav Map Layer 2 – Layer 2 goodness map
	NL3	n/a	n/a	Eng. Cameras	Nav Map Layer 3 – Layer 3 goodness map
	NL4	n/a	n/a	Eng. Cameras	Nav Map Layer 4 – Layer 4 goodness map
	NL5	n/a	n/a	Eng. Cameras	Nav Map Layer 5 – Layer 5 goodness map
	NL6	n/a	n/a	Eng. Cameras	Nav Map Layer 6 – Layer 6 goodness map
	NL7	n/a	n/a	Eng. Cameras	Nav Map Layer 7 – Layer 7 goodness map
	NL8	n/a	n/a	Eng. Cameras	Nav Map Layer 8 – Layer 8 goodness map
	NL9	n/a	n/a	Eng. Cameras	Nav Map Layer 9 – Layer 9 goodness map
	NLA	n/a	n/a	Eng. Cameras	Nav Map Layer 10 – Layer 10 goodness map
	NLB	n/a	n/a	Eng. Cameras	Nav Map Layer 11 – Layer 11 goodness map
	NLC	n/a	n/a	Eng. Cameras	Nav Map Layer 12 – Layer 12 goodness map
	NLD	n/a	n/a	Eng. Cameras	Nav Map Layer 13 – Layer 13 goodness map
	NLE	n/a	n/a	Eng. Cameras	Nav Map Layer 14 – Layer 14 goodness map
	NLF	n/a	n/a	Eng. Cameras	Nav Map Layer 15 – Layer 15 goodness map

Type	Product Identifier	Size	Format (bits)	Instruments	Description
	NT0	n/a	n/a	Eng. Cameras	Nav Map Temporary Storage Layer 0 – temporary storage for Layer 0 goodness map
	NT1	n/a	n/a	Eng. Cameras	Nav Map Temporary Storage Layer 1 – temporary storage for Layer 1 goodness map
	NT2	n/a	n/a	Eng. Cameras	Nav Map Temporary Storage Layer 2 – temporary storage for Layer 2 goodness map
	NT3	n/a	n/a	Eng. Cameras	Nav Map Temporary Storage Layer 3 – temporary storage for Layer 3 goodness map
	NT4	n/a	n/a	Eng. Cameras	Nav Map Temporary Storage Layer 4 – temporary storage for Layer 4 goodness map
	NT5	n/a	n/a	Eng. Cameras	Nav Map Temporary Storage Layer 5 – temporary storage for Layer 5 goodness map
	NT6	n/a	n/a	Eng. Cameras	Nav Map Temporary Storage Layer 6 – temporary storage for Layer 6 goodness map
	NT7	n/a	n/a	Eng. Cameras	Nav Map Temporary Storage Layer 7 – temporary storage for Layer 7 goodness map
	NT8	n/a	n/a	Eng. Cameras	Nav Map Temporary Storage Layer 8 – temporary storage for Layer 8 goodness map
	NT9	n/a	n/a	Eng. Cameras	Nav Map Temporary Storage Layer 9 – temporary storage for Layer 9 goodness map
	NTA	n/a	n/a	Eng. Cameras	Nav Map Temporary Storage Layer 10 – temporary storage for Layer 10 goodness map
	NTB	n/a	n/a	Eng. Cameras	Nav Map Temporary Storage Layer 11 – temporary storage for Layer 11 goodness map
	NTC	n/a	n/a	Eng. Cameras	Nav Map Temporary Storage Layer 12 – temporary storage for Layer 12 goodness map
	NTD	n/a	n/a	Eng. Cameras	Nav Map Temporary Storage Layer 13 – temporary storage for Layer 13 goodness map
	NTE	n/a	n/a	Eng. Cameras	Nav Map Temporary Storage Layer 14 – temporary storage for Layer 14 goodness map
	NTF	n/a	n/a	Eng. Cameras	Nav Map Temporary Storage Layer 15 – temporary storage for Layer 15 goodness map
	NWR	n/a	n/a	Eng. Cameras	Nav Map Wraparound – <i>to be determined</i>
	NSF	n/a	n/a	Eng. Cameras	Nav Map Stereo Filters – pixel-by-pixel labeling of stereo filter that rejected pixel value
	NSD	n/a	n/a	Eng. Cameras	Nav Map Stereo Disparity – left disparity image
	NLR	n/a	n/a	Eng. Cameras	Nav Map Left Rectified – left rectified image

Type	Product Identifier	Size	Format (bits)	Instruments	Description
	NRR	n/a	n/a	Eng. Cameras	Nav Map Right Rectified – right rectified image
	N2F	n/a	n/a	Eng. Cameras	Nav Map Second Stereo Filters – <i>to be determined</i>
	N2D	n/a	n/a	Eng. Cameras	Nav Map Second Stereo Disparity – <i>to be determined</i>
	N2L	n/a	n/a	Eng. Cameras	Nav Map Second Left Rectified – <i>to be determined</i>
	N2R	n/a	n/a	Eng. Cameras	Nav Map Second Right Rectified – <i>to be determined</i>
	NVF	n/a	n/a	Eng. Cameras	Nav Map VO Features – visual odometry feature list
	NMS	n/a	n/a	Eng. Cameras	Nav Map Memory Manager Status – ASCII dump of NAV memory allocation
	NDC	n/a	n/a	Eng. Cameras	Nav Map D-star Cost – D-star cost map
	NPC	n/a	n/a	Eng. Cameras	Nav Map D-star Planning Cost – <i>to be determined</i>
	NDR	n/a	n/a	Eng. Cameras	Nav Map D-star Layer Cost – <i>to be determined</i>
	NDF	n/a	n/a	Eng. Cameras	Nav Map D-star Field – D-star field map
	NDL	n/a	n/a	Eng. Cameras	Nav Map D-star Look Ahead – D-star Lookahead buffer
	NKO	n/a	n/a	Eng. Cameras	Nav Map Keepout – keepout zones
	NKS	n/a	n/a	Eng. Cameras	Nav Map Keepout Site – <i>to be determined</i>
	NKP	n/a	n/a	Eng. Cameras	Nav Map Keepout Path Site – <i>to be determined</i>
	NMI	n/a	n/a	Eng. Cameras	Nav Map IDPH – <i>to be determined</i>
	NSG	n/a	n/a	Eng. Cameras	Nav Map Step Goodness – <i>to be determined</i>
	NTG	n/a	n/a	Eng. Cameras	Nav Map Tilt Goodness – <i>to be determined</i>
	NRG	n/a	n/a	Eng. Cameras	Nav Map Roughness Goodness – <i>to be determined</i>
	NGK	n/a	n/a	Eng. Cameras	Nav Map Good Keep – <i>to be determined</i>
	NSP	n/a	n/a	Eng. Cameras	Nav Map Stereo Points – <i>to be determined</i>
	NNE	n/a	n/a	Eng. Cameras	Nav Map Num Entries – <i>to be determined</i>

#### 4.3.1 Engineering Camera Instrument Suite

The binary content of the Engineering Camera image EDR data product is a copy of the scene that had been projected onto the camera instrument's charge-coupled device (CCD) and shifted into the CCD memory buffer, as shown in Figure 2.1 previously. The image data will be decoded and decompressed in single frame form as the image EDR. The Full Frame form of a standard image EDR has the maximum dimensions of 1024 lines by 1024 samples.

For the Engineering Camera image EDR, there are two possible radiometric formats of telemetered image data. In the first case, 12-bit data scaled onboard to 8-bit via a “12 to 8-bit” Lookup Table (LUT) or, by bit shifting, will be downlinked as 8-bit data and stored “as is” on the ground in a single unsigned byte. In the second case, 12-bit data without onboard LUT scaling or bit shifting will be downlinked as 12-bit data and stored “as is” in the 12 lowest bits of the signed 16-bit integer. The binary data may be returned in uncompressed or compressed form. Data returned as compressed are ICER [Ref 31] or LOCO encoded and will be decompressed as part of the EDR processing.

## 4.3.2 ChemCam Instrument Suite

### 4.3.2.1 RMI Image EDR

The binary content of the RMI image EDR product is a copy of the scene that had been projected onto the camera instrument’s CCD onboard and read out from the CCD memory buffer, as shown in Figure 2.2.1.1 previously. The Full Frame form of a standard image EDR has the maximum dimensions of 1024 lines by 1024 samples. The image data, telemetered down at 10 bits/pixel, will be decoded in single frame form and stored in the 10 lowest bits of a signed 16-bit integer as the image EDR. Like the Engineering Camera instruments, data returned as compressed are ICER or LOCO encoded and will be decompressed as part of the EDR processing.

### 4.3.2.2 LIBS Spectrum EDR

The binary content of the LIBS spectrum EDR is comprised of intensity values, or data numbers (DNs). Depending on which of the three variants of spectroscopy activity were commanded, the values fall somewhere within the stored 16-bit or 32-bit data range. Unlike the RMI image data, LIBS spectrum data are only returned as uncompressed.

### 4.3.2.3 State-of-Health (SOH) EDR

The binary content of the SOH EDR is comprised of metadata DPOs only. For the ChemCam Body Unit, the metadata are stored as a vector of 9 entities in 16-bit unsigned integer format. For the ChemCam Mast Unit, the metadata are stored as a vector of 39 entities in 16-bit unsigned integer format.

## 4.3.3 MMM Camera Instrument Suite

The data from the MMM camera suite can come down in one of four different ways: color or grayscale JPEG, losslessly-compressed, or uncompressed. These methods apply across all of the image EDR types (standard image, Z-stack, depth map, video frame) and geometry types (full-frame, subframe, thumbnail).

### 4.3.3.1 Bayer Pattern

The MMM cameras create images of 1648x1200 pixels. Each pixel on the CCD has an individual red (R), green (G), or blue (B) filter arranged in a Bayer pattern, which consists of repeated squares of pixels:

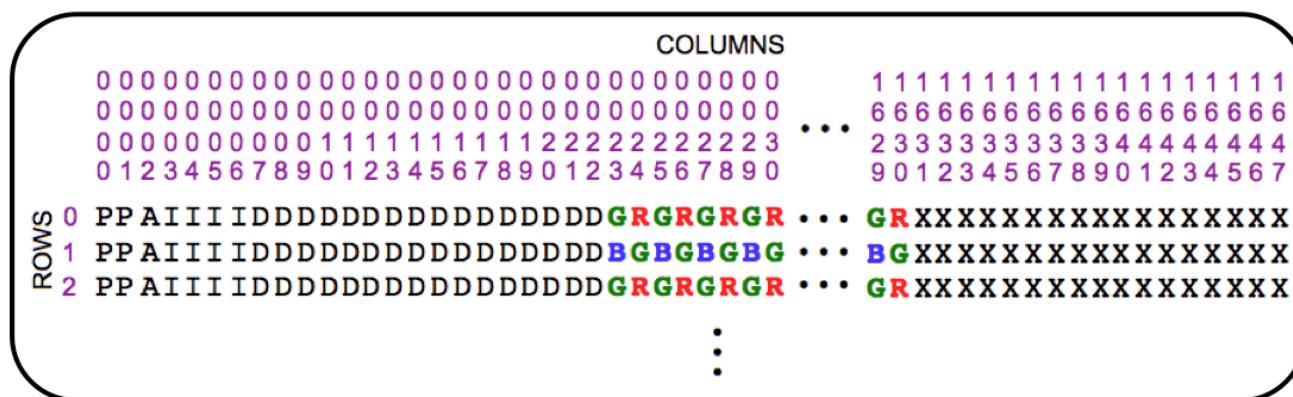

$$\begin{matrix} (\textcolor{red}{R}, \textcolor{teal}{G}) \\ (\textcolor{teal}{G}, \textcolor{blue}{B}) \end{matrix}$$

This allows an RGB color picture to be taken in a single exposure. Additional geology filters are available, which interact with the Bayer filters in complex ways. See Section 2.3 for an overview or

the MMM camera documentation for details.

Of the 1648 pixels per line, only 1608 are photoactive pixels. The line structure is shown in Figure 4.3.3.1 below, and is broken down into the following:

- 2 dark pixels from the end of the previous line (“P” in Figure 4.3.3.1)
- 1 invalid ADC pipeline pixel from the interline time (“A” in Figure 4.3.3.1)
- 4 isolation pixels (“I” in Figure 4.3.3.1)
- 16 dark pixels (“D” in Figure 4.3.3.1)
- 1608 photoactive RGB pixels (“R”, “G”, “B” in Figure 4.3.3.1)
- 17 dark, isolation, and overscan pixels (“X” in Figure 4.3.3.1)

**Figure 4.3.3.1 - MMM Camera RGB in Bayer Pattern Layout on CCD**

Because there are an odd number of starting dark pixels, the first valid pixel (23) on even lines will be G (GRGRGR...) while on odd lines it will be B (BGBGBG...).

## 4.4 EDR Product Structure

As in the previous section “EDR Product Format”, description of EDR product structures in this section will be by instrument suite: a) Engineering Cameras, b) ChemCam Instruments, c) MMM Instruments.

This section details the specifics of a variety of EDR structures, taking into account the concept of product labels and the product’s binary content described previously in Sections 3.2 and 3.3, respectively.

Figure 4.4 shows EDR products in this SIS with four possible structures: 1) an image EDR that has a VICAR label wrapped by an ODL label, Diagram A, 2) an image EDR identical in structure to #1 but with additional “auxiliary” data (discussed in Section 4.4.2), shown in Diagram B, 3) a spectrum EDR that has an ODL label followed by “auxiliary” data, shown in Diagram C, and 4) a state-of-health EDR that has only an ODL label, shown in Diagram D. All are shown with detached ASCII PDS-compliant labels for archive purposes.

For a description of the PDS and ODL labels, see Section 3.2.2, and for a description of the VICAR Label, see Section 3.2.3, and for a mapping between PDS/ODL and VICAR, see Section 3.2.4.

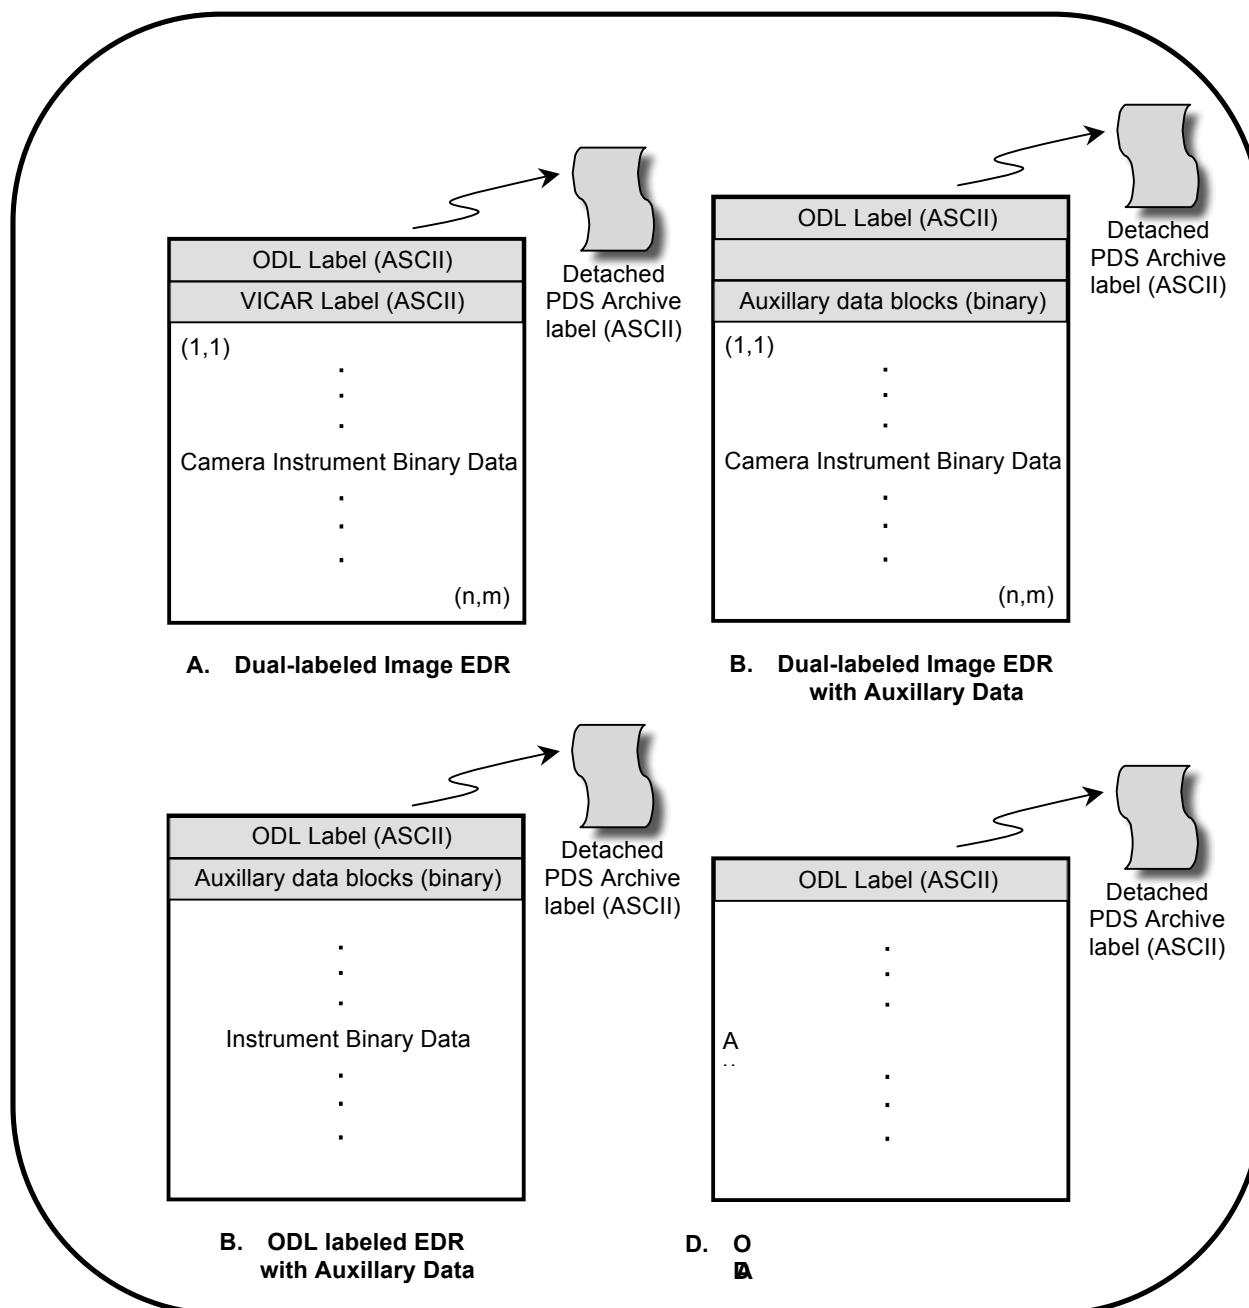

Figure 4.4 - EDR Product Structures

#### 4.4.1 Engineering Camera Instrument Suite

All image EDRs for the Engineering Camera instrument suite have the same structure, containing the four attributes shown in Diagram A of Figure 4.4. They are listed below. The first three attributes comprise the image file and consist of an integral number of “records”, where the record size is the size needed to contain one line of image data. The fourth attribute is an external (detached) label file for archive purposes:

- 1) An operations label in ODL (ASCII) format
- 2) An operations label in VICAR (ASCII) format
- 3) An  $n \times m$  block of binary image data with the origin at the upper left pixel in line (row) 1, sample (column) 1. Note that some camera EDR products will be rotated so that the origin (1,1) is not the same as the CCD origin.
- 4) A detached PDS-compliant label, in a separate file. Its availability to users will not coincide with the delivery of the EDR to the ODS file system; it will be delivered later with the release of the Archive Volume by PDS.

#### 4.4.2 ChemCam Instrument Suite

The RMI image EDR, LIBS spectrum EDR and state-of-health (SOH) EDR are common in one aspect: they each include “auxiliary” data that augments the binary instrument data and other metadata parts of the EDR. Here, the term “auxiliary” refers to a set of one or more binary Data Product Objects (DPOs) that are the components of the binary “.dat” file generated by MPCS (refer to Section 4.1). They contain instrument data (image or spectrum information) and/or metadata (commands, temperature readouts, etc). Within the ChemCam EDR, these DPOs are stored in the “binary header” section of the file in the format provided by the spacecraft, following all labels but preceding the binary instrument content. The size and number of DPOs in any ChemCam EDR can vary, depending on the commanding of onboard data acquisition for that EDR. Each DPO starts on a record boundary and is padded to the record length if necessary. At minimum, all ChemCam EDRs contain the DPO type “Ancillary” and multiple instances of the DPO type “State-of-Health” (SOH), which also provide sources for some of the product label metadata items. Refer to Section 3.2.2.7 for a description of the label pointers that provide the necessary offsets to parse the DPOs in the EDR.

Because RMI image EDRs are VICAR formatted files, they differ in the way they get constructed in comparison to LIBS and SOH EDRs. So it follows that their respective labels, necessary in describing the embedded DPOs, are constructed differently. In building the RMI image EDR, program MSLEDRGEN reads the RMI “.emd” metadata file to identify each DPO that will be extracted from the RMI “.dat” file. Each DPO is padded to the width of the VICAR image during its insertion into the EDR as a separate binary line before the image. To accommodate the VICAR file format, the RMI label is minimal in content descriptive of the DPOs. In lieu of containing the detailed DPO describing objects, the RMI EDR label contains pointers that reference external “.FMT” files containing such objects. This differs from the LIBS and SOH EDR labels, which generally contain the detailed DPO describing objects in the body of the label. As an example, the DPO type “SOH” embedded in the RMI EDR requires three descriptive objects to appropriately define it. In the LIBS EDR, those three objects are contained in the EDR label. However, the RMI EDR label has a pointer to an external “.FMT” file that contains the three SOH DPO describing objects.

##### 4.4.2.1 RMI Image EDR

The image EDR structure for the RMI camera consists of five parts. The first four of these are part of the image file itself; the fifth is a detached PDS label. Each of the four parts of the image file consist of an integral number of “records”, where the record size is the size needed to contain one line of image data.

So structurally, the EDR matches Diagram B in Figure 4.4 with the following design:

- 1) An operations label in ODL (ASCII) format
- 2) An operations label in VICAR (ASCII) format
- 3) Zero or more records of binary header data, which contain auxiliary information in the form of DPOs previously described in Section 4.4.2.
- 4) An  $n \times m$  block of binary image data with the origin at the upper left pixel in line (row) 1, sample (column) 1. Note that some camera EDR products will be rotated so that the origin (1,1) is not the same as the CCD origin.
- 5) A detached PDS-compliant label, in a separate file. Its availability to users will not coincide with the delivery of the EDR to the ODS file system; it will be delivered later with the release of the Archive Volume by PDS.

#### **4.4.2.2 LIBS Spectrum EDR**

The spectrum EDR structure for the LIBS instrument is similar to the RMI image EDR structure, minus the VICAR label. So, the EDR consists of four parts. The first three of these are part of the spectrum (one or more spectra) file itself; the fourth is a detached PDS label. Each of the three parts of the spectrum file consist of an integral number of “records”, where the record size is the size needed to contain one spectrum.

Therefore, the EDR matches Diagram C in Figure 4.4 with the following design:

- 1) An operations label in ODL (ASCII) format
- 2) Zero or more records of binary header data, which contain auxiliary information in the form of DPOs previously described in Section 4.4.2.
- 3) A bit stream of binary spectra data.
- 4) A detached PDS-compliant label, in a separate file. Its availability to users will not coincide with the delivery of the EDR to the ODS file system; it will be delivered later with the release of the Archive Volume by PDS.

#### **4.4.2.3 State-of-Health (SOH) EDR**

The SOH EDR structure for the ChemCam instrument suite contains only binary auxiliary data, containing no instrument or binary header data.

So, the EDR consists of three parts and matches Diagram D in Figure 4.4 with the following design:

- 1) An operations label in ODL (ASCII) format
- 2) Zero or more records of binary auxiliary information in the form of DPOs previously described in Section 4.4.2.
- 3) A detached PDS-compliant label, in a separate file. Its availability to users will not coincide with the delivery of the EDR to the ODS file system; it will be delivered later with the release of the Archive Volume by PDS.

### **4.4.3 MMM Camera Suite**

The EDR structure for the suite of MMM Cameras is the same as that described for the Engineering Cameras in Section 4.4.1.

Specifically, the MMM Camera image EDR matches Diagram A in Figure 4.4 with the following design:

- 1) An operations label in ODL (ASCII) format

- 2) An operations label in VICAR (ASCII) format
- 3) An  $n \times m$  block of binary image data with the origin at the upper left pixel in line (row) 1, sample (column) 1. Note that some camera EDR products will be rotated so that the origin (1,1) is not the same as the CCD origin.

## 4.5 EDR Product Validation

Validation of the MSL EDRs will fall into two primary categories: automated and manual. Automated validation will be performed on every EDR product produced for the mission. Manual validation will only be performed on a subset.

Automated validation will be performed as a part of the archiving process and will be done simultaneously with the archive volume validation. Validation operations performed will include such things as verification that the checksum in the label matches a calculated checksum for the data product (i.e., that the data product included in the archive is identical to that produced by the real-time process), a validation of the PDS syntax of the label, a check of the label values against the database and against the index tables included on the archive volume, and checks for internal consistency of the label items. The latter include such things as verifying that the product creation date is later than the earth received time, and comparing the geometry pointing information with the specified target. As problems are discovered and/or new possibilities identified for automated verification, they will be added to the validation procedure.

Manual validation of the images will be performed both as spot-checking of data through-out the life of the mission, and comprehensive validation of a sub-set of the data (for example, a couple of days' worth of data). These products will be viewed by a human being. Validation in this case will include inspection of the image or other data object for errors (like missing lines) not specified in the label parameters, verification that the target shown / apparent geometry matches that specified in the labels, verification that the product is viewable using the specified software tools, and a general check for any problems that might not have been anticipated in the automated validation procedure.

## 5. RDR PRODUCT SPECIFICATION

RDR data products described in this document will be generated by MIPL personnel using the Mars Suite of VICAR image processing software within OPGS at JPL and the ChemCam Science Team using team-developed software at Los Alamos National Laboratory (LANL) in New Mexico, Institut de Recherche en Astrophysique et Planétologie (IRAP) and Centre National d'Etudes spatiales (CNES) in France. The RDRs produced will be "processed" data. The input will be one or more image or spectrum EDR or RDR data products and the output will be formatted according to this SIS. Additional metadata may be added by the software to the product label.

There may be multiple versions of image and spectrum RDRs. The RDR data product will be placed into FEI for distribution.

## 5.1 RDR General Processing

Processing is different for each image RDR type, as described in this section. In general, each RDR process inherits the metadata from its source EDR/RDR, modifying a portion of the metadata as necessary to reflect the subsequent output RDR.

### 5.1.1 Image RDRs

Image RDR data products described in this section will be generated by the EDR/RDR data product pipeline operating under the OPGS at JPL. Pipeline processing will include

For Engineering Camera and MMM camera data, and to a lesser degree ChemCam RMI data, RDRs will be processed using the Mars Suite subset of the VICAR image processing software developed at MIPL. The various image RDR interfaces in the VICAR processing flow are shown in Figure 5.1.1, and their descriptions are described subsequently in Section 5.2.

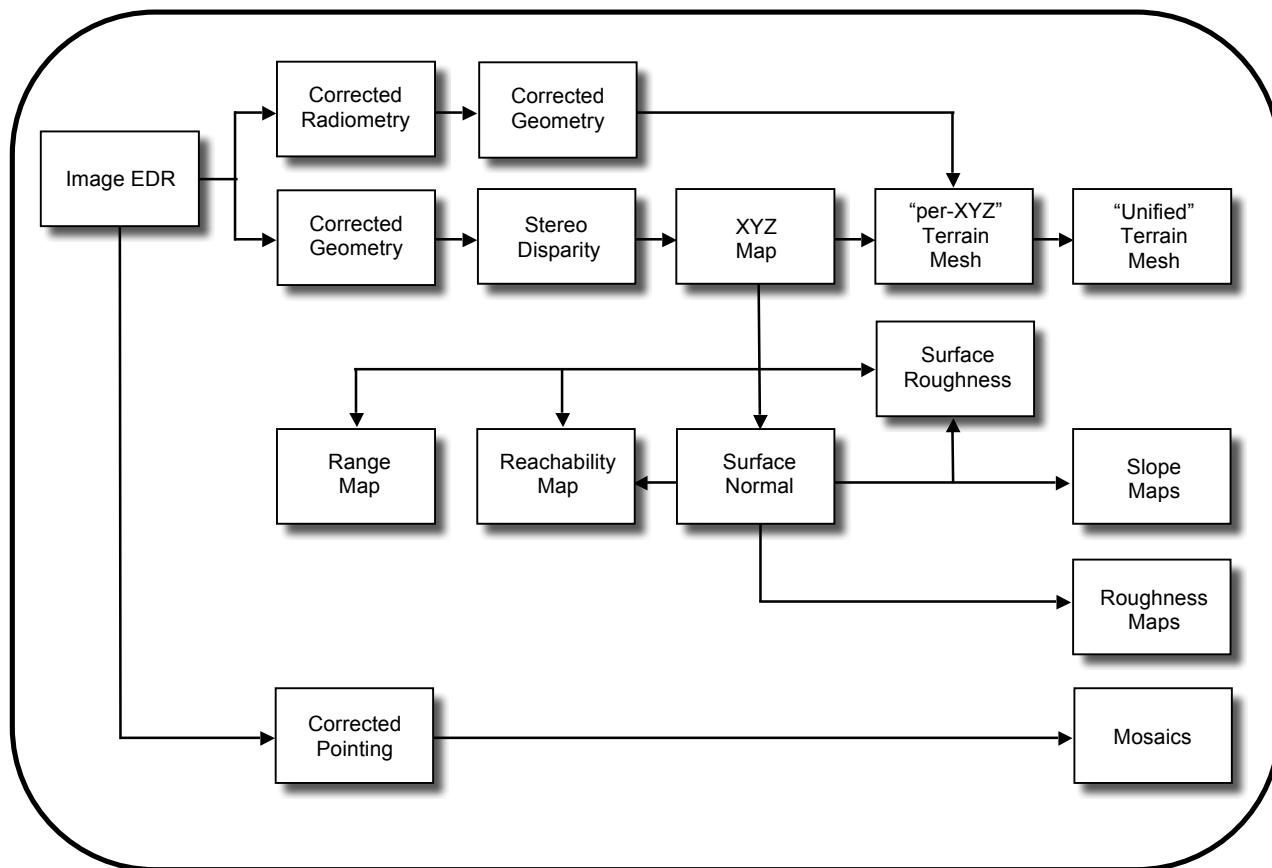

Figure 5.1.1 - Image RDR Processing Flow

### 5.1.1.1 Common Processing

Although the various Engineering Camera and MMM camera RDR product types are specific in nature, certain types of processing are often common to different RDR base files. These are described below.

#### 5.1.1.1.1 Geometrically Corrected Images (Linearization)

EDRs and single-frame RDRs are described by a camera model. This model, represented by a set of vectors and numbers, permit a point in space to be traced into the image plane, and vice-versa. Linearization mode is indicated by the "geom" flag in the filename.

EDR camera models are derived by acquiring images of calibration targets with known geometry at a fixed azimuth/elevation. The vectors representing the model are derived from analysis of this imagery. These vectors are then translated and rotated based on the actual pointing of the camera to represent the conditions of each specific image. The resulting vectors make up the "camera model" for the EDR.

The Navcam, ChemCam, and MMM cameras use a CAHVOR model, while the Hazcams use a more general CAHVORE model. Both model types are nonlinear and involve some complex calculations to transform line/sample points in the image plane to XYZ positions in the scene. To simplify this, the images are "warped", or reprojected, in a process often called "linearization", such that they can be described by a linear CAHV model. See Figure 5.1.1.1.1 for a visual comparison between a Front Hazcam image EDR (left) and the Front Hazcam "linearized" image RDR (right).

Figure 5.1.1.1.1 - Image EDR (left) vs "Linearized" Image RDR (right)

This linearization process has several benefits:

- 1) It removes geometric distortions inherent in the camera instruments, with the result that straight lines in the scene are straight in the image.
- 2) It aligns the images for stereo viewing, known as epipolar alignment. Matching points are on the same image line in both left and right images, and both left and right models point in the same direction.
- 3) It facilitates correlation, allowing the use of 1-D correlators in some cases.
- 4) It simplifies the math involved in using the camera model.

However, it also introduces some artifacts in terms of scale change and/or omitted data (see the references).

The linearized CAHV camera model is derived from the EDR's camera model by considering both the left and right eye models and constructing a pair of matched linear CAHV models that conform to the above criteria. For details on this algorithm see the references.

There are two types of linearization, indicated in the filename. For the nominal case, each image is linearized using a virtual camera model constructed to indicate what the other eye's model would look like at the same pointing. This allows each image to be processed independently, without the need to find the stereo partner (or even acquire the image), yet provides the same results as if the match had been performed.

However, this virtual partner is not always appropriate. In some cases the stereo pair is composed of images acquired at different pointings (often needed for very close-range mast work in order to achieve sufficient overlap), different positions (for an arm-based camera such as MAHLI), different rover locations (long-baseline stereo, used to resolve distances far greater than a normal stereo pair can do), different conditions (such as different focus or zoom on the Mastcam), or even different instruments. These cases require linearizing with the actual stereo partner.

Regardless of linearization type, the image is then projected, or warped, from the CAHVOR/CAHVORE model to the CAHV model. This involves projecting each pixel through the EDR camera model into space, intersecting it with a surface (which matters only for the CAHVORE-based Hazcams and is a 1m radius sphere centered on the camera), and projecting the pixel back through the CAHV model into the output image.

C - The 3D position of the entrance pupil

A - A unit vector normal to the image plane pointing outward (towards C)

H - A vector pointing roughly rightward in the image; it is a composite of the orientation of the CCD rows, the horizontal scale, the horizontal center

V - A vector pointing roughly downward in the image; it is a composite of the orientation of the CCD columns, the vertical scale, the vertical center, and A.

If P is a point in the scene then the corresponding image locations x and y can be computed from:

$$x = \frac{(P - C) H}{(P - C) A}$$

$$y = \frac{(P - C) V}{(P - C) A}$$

For details on the camera model math and calibration and more description of the CAHV-model family, see references [Ref 18] through [Ref 27]. Note that the X and Y positions above are 0-based coordinates; i.e., the coordinate (0,0) is the center of the upper-left pixel. This is different than the common PDS convention of 1-based coordinates, where (1,1) is the center of the upper-left pixel, used elsewhere in this document.

#### **5.1.1.1.2 Image Overlays**

Many image RDR types represent some quantity other than intensity of light, such as XYZ or slope. The value at each pixel indicates the measurement of the quantity at the corresponding point in the original image. These types can be overlaid on a background of the EDR or other intensity image, using color coding to represent the RDR value. See Figures 5.2.1.4 (XYZ overlay), 5.2.1.5 (Range overlay) and 5.2.1.9.1 (Arm Reachability overlay) for examples. This gives a visualization of the RDR in context of the scene. Overlays are generally indicated by a product type ending with “O” in the filename.

#### **5.1.1.1.3 Filled Images**

Many RDR types do not achieve full coverage, e.g. the correlator is unable to find a solution at every point or the XYZ point failed the various filters. These “holes” are preserved in the RDRs using some value to indicate no solution (see the MISSING\_CONSTANT labels). For ops work, it is critical to know where the holes are, so they are preserved in all nominal RDRs. Some RDRs created for purposes other than operations have these holes filled in using an interpolation mechanism. These are referred to as “filled” RDRs. Filled RDRs are generally indicated by a product type ending with “F” in the filename (but not all trailing “F”s mean Filled).

#### **5.1.1.1.4 Color Processed Images**

The MMM cameras routinely produce color images via their Bayer-pattern CCD's. The de-Bayering is typically done onboard but can also be done on the ground if not. In any case, RDRs that contain image data, such as ILT, RAD, RAS, etc., are produced by pulling the three bands apart into separate files, processing each independently, and then combining them into color again. Both the color image and one or more of the individual bands are kept as end products, as specified in the Config flag (3rd character) in the filename.

RDRs related to image geometry (e.g. disparity, XYZ, all downstream products) are created using only the Green band extracted from the color image. The Green band is used because there are two green pixels per Bayer cell, as opposed to one for red and blue, leading to a higher resolution image.

Note that not all MMM images are color; in particular some of the geology filters for the Mastcam produce single-band images, which are processed like any other single-band image.

#### **5.1.1.1.5 Rover Volume Exclusion Image Masks**

For the purposes of Terrain Mesh RDR generation, OPGS will create “Rover Volume Exclusion Mask” files that can be applied to several types of RDR (primarily XYZ). They are used to filter out rover features from generated terrain products, as well as the horizon and other undesirable features. They are single-band, byte files corresponding to the source image, where 255 indicates the corresponding pixel should be removed, or 0 indicates the pixel should remain in the output. These mask files typically have an “M” as the first character of the product type.

### 5.1.1.6 Masked Images

The exclusion masks, or other masks, can be combined with the RDR to create a Masked image. The contents are identical to the source RDR (most often, XYZ) except that where the mask is 255, the value is set to the value specified by MISSING\_CONSTANT. Masked files typically have an “M” as the third character of the product type (exception: masked ARM is called ARK).

### 5.1.1.7 EDR-like RDRs

The LIN and BAY RDRs are exactly like EDRs except they have had linearization or de-Bayer processing done to them. This processing can be done to any image and does not change the product type code; the config, geom, and/or samp fields change instead. The LIN and BAY product type codes exist simply to ensure that the “EDR” product type code is not used for any RDRs.

## 5.1.2 Spectroscopy RDRs

Spectroscopy data products derived from the ChemCam LIBS spectrum EDR will be RDRs generated by software tools used and developed by ChemCam instrument team members at LANL. To generate a LIBS spectroscopy RDR product, the spectral data are extracted from the binary EDR file and converted to an ASCII format. Multivariate analyses is performed on the spectral data, and elemental abundances are reported using partial least squares regression (PLS).

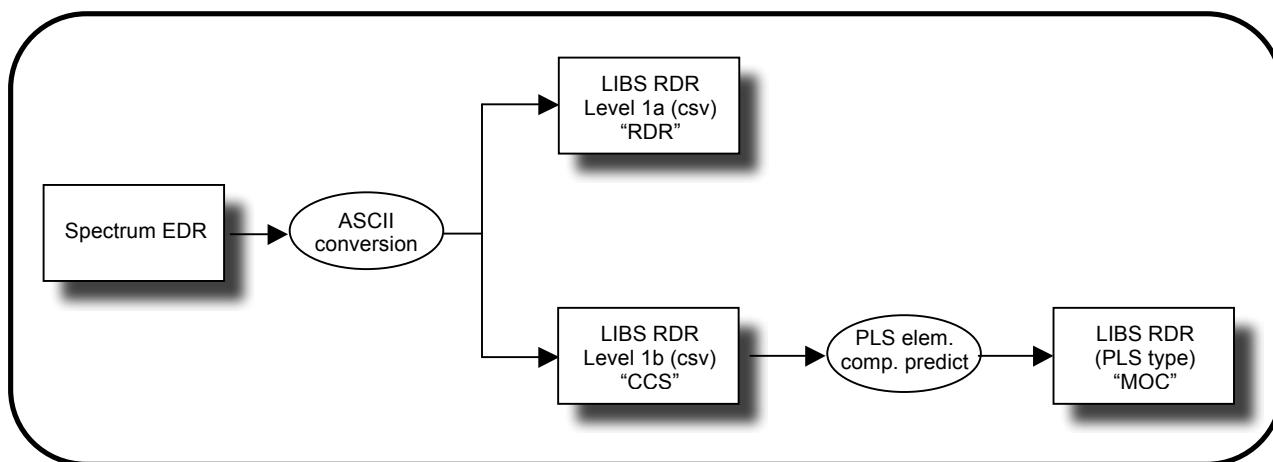

Figure 5.1.2 - Spectroscopy (LIBS) RDR Processing Flow

## 5.2 RDR Product Types

Descriptions for the various RDR product types are provided in this section. Refer also to Tables 5.4.1 and 5.4.2 for a concise list of the RDR product types.

## 5.2.1 Image RDRs

### 5.2.1.1 “Inverse LUT” RDR

The ILT RDR is produced by OPGS to reconstruct the original 12-bit pixels generated by the camera sensors. If the EDR is already in 12-bit format, ILT is simply a copy. However, if the EDR is in “8-bit” format (see Section 4.4) as a result of onboard “12 to 8-bit” scaling using a Lookup Table (LUT) or bit shifting, then an Inverse LUT (ILUT) is to be used to rescale the 8 lowest bits to the 12 lowest bits in the 16-bit signed integer.

The ILC type has had additional processing to remove certain instrument artifacts. At launch for MSL, this type is not used. However, operational experience with MER shows that over time, cameras degrade, with noise appearing due to radiation exposure and other effects. ILC is thus a placeholder for processing such as despiking, which removes this kind of noise, or interpolation of dead pixels.

The ILP type represents an ILT or ILC that has been pointing-corrected (see the Mosaic section) or re-localized based on ground analysis. It is expected that a special processing flag will be set for any products employing this type.

### 5.2.1.2 “Radiometrically Corrected” RDR

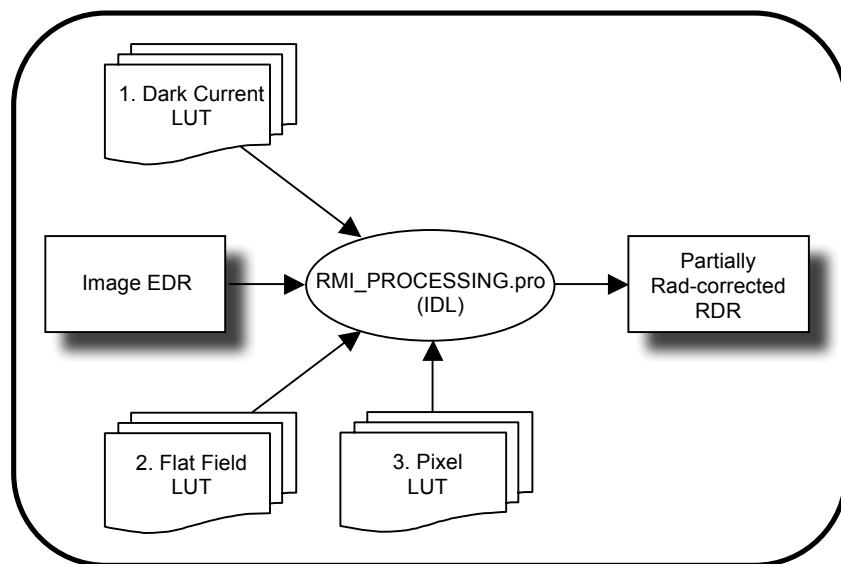

There are 3 different kinds of radiometrically corrected products. “RA\*” have been corrected to absolute radiance units of W/m<sup>2</sup>/nm/steradian. “RI\*” products have been corrected for instrument effects only, and are in units of DN. “IO\*” products are radiance factor (I/F) and are dimensionless. Within each kind, the values may be represented as floating-point values, or scaled to integers for ease of manipulation.

Independent of type, there are multiple methods of performing radiometric correction, distinguished by the RADIOMETRIC\_CORRECTION\_TYPE keyword. The two described here are CHEMRAD and MIPLRAD.

#### 5.2.1.2.1 CHEMRAD Method

This refers to partial radiometric correction of ChemCam RMI image data performed using an image processing toolkit developed in IDL by ChemCam Science Team members at IRAP and CNES in France. It is deemed “partial” in the sense that the raw image data are not calibrated to physical radiance units. Although the calibration portion of radiometric correction is not performed for the input EDR, other corrections are applied. These corrections are a function of the image geometry, exposure time (milliseconds), sensor temperature (deg Celsius), and target distance (meters). The latter three are extractable from the SOH portion of the EDR file.

The main IDL procedure is RMI\_PROCESSING.pro, which can apply successive corrections to RMI EDR image defects by incorporating, in a specific order, several lookup tables (LUTs) constructed during ground calibrations. The processing flow is shown in Figure 5.2.1.2.1.

**Figure 5.2.1.2.1 - Partial Radiometric Correction for ChemCam RMI**

During the ground calibrations, several lookup tables were built with the constant values necessary to compute the corrections; they are included with the RMI\_PROCESSING.pro code. These lookup tables will need to be revised with in-flight calibrations at a frequency to be defined.

The code applies corrective image processing steps in the reverse order of the apparition of the defects in the image, since one effect can influence the subsequent ones. In order, the corrections are as follows:

1. Subtract the estimated dark current image (temperature, time). This step incorporates a dark current LUT.
2. Iteratively (row by row) subtract the smearing drag (time) due to the CCD.
3. Iteratively (row by row) subtract the ghost image that is linked to the LIBS telescope and optics.
4. Divide by the estimated flat field that is linked to the LIBS telescope and optics. This step incorporates a flat field LUT.
5. Correct for known bad pixels by replacing them with median of neighboring pixels. This step incorporates a pixel LUT.
6. Apply a mask corresponding to the footprint of the telescope on the useful part of the CCD detector.
7. Enhance the contrast of the corrected image using histogram equalization.

The resulting RDR product is only partially radiometrically corrected and is not calibrated into physical radiance units. Note that the default flat field LUT is derived from a sky observation on Sol 32. Data acquired previous to Sol 32 were reprocessed using the Sol 32 flat field LUT.

Effects not accounted for in the correction process include:

- a) Non-linearity - Each pixel of the CCD is a potential well, in which electrons are trapped. The number of trapped electrons is an affine function of the lighting, but above a certain threshold the linearity is broken (saturation). At room temperatures, at gain 12, the non-linearity starts around 700 counts, and saturation is reached around 850 counts, i.e. an integration of about 10 ms. This response function of the detector is a complex function of the temperature and

can vary from pixel to pixel. It has not been calibrated since the primary objective of the RMI is to give a qualitative context of the LIBS experiment.

- b) Direct Light - Some light from the far field can reach the detector without passing by the telescope mirrors, despite the baffle on the secondary mirror. It can be seen as extra light in the bottom part of some images, and sometimes as the focused picture of the distant scene. The diffuse light is taken into account in the determination of the reference flat field, and thus rather well corrected, but the focused distant scene cannot be corrected. However, this rare and faint, except in the corners that are removed when the telescope mask is applied.

#### **5.2.1.2.2 MIPLRAD Method**

This refers to radiometric correction of any camera instrument data systematically performed by MIPL (OPGS at JPL) to meet tactical time constraints imposed by rover planners. The exception is ChemCam RMI data, which were processed only using the CHEMRAD method described in the previous section. The resulting rad-corrected RDRs are integrated into terrain mesh products used for traverse planning. This method is typically less precise than the methods used by the science teams.

MIPLRAD is a first-order correction only and should be considered approximate. MIPLRAD first backs out any onboard flat field that was performed. It then applies the following corrections: flat field, exposure time, temperature-compensated responsivity. The result is calibrated to physical units of W/m<sup>2</sup>/nm/sr. The actual algorithm and equations used for MIPLRAD are shown below. Not every step applies to each camera type. Each correction is applied in sequence, to every pixel:

1. For the Engineering Camera instrument suite only, if on-board flat-fielding has been applied, it is backed out according to the parameters in FLAT\_FIELD\_CORRECTION\_PARM, which is described in Appendix F and defines ff(x,y).

$$\text{output}(x,y) = \text{input}(x,y) / \text{ff}(x,y)$$

2. For the flat-field adjustment, the x and y coordinates are adjusted based on downsampling and subframing to find the corresponding pixel in the flat field, then the DN is divided by the flat field value (obtained by pre-launch calibration):

$$\text{output}(x,y) = \text{input}(x,y) / \text{flat\_field}(x',y')$$

3. Exposure time is then removed. Exposure time comes from EXPOSURE\_DURATION, converted to seconds:

$$\text{output}(x,y) = \text{input}(x,y) / \text{exposure\_time}$$

4. The temperature responsivity is removed next. The temperature of the CCD is determined from INSTRUMENT\_TEMPERATURE using the following rules, where the first valid temperature found (0.0 is ignored as no-reading, and >50C is considered broken) is the one used:

- a) Use the CCD temp of said camera
- b) Use the CCD temp of left/right partner
- c) Use the CCD temp of alternate A/B side same-eye camera
- d) Use the CCD temp of alternate A/B side left/right partner
- e) Use the CCD temp of “similar” camera (other Hazcam, other mast-mount) in a-d order
- f) Use the CCD temp of any camera

g) Use electronics temp instead of CCD in a-f order

The temperature is combined with parameters R0, R1, and R2, which were derived from ground calibration and come from the flat field parameter file (see Appendix F) according to the following formula:

$$\text{output}(x,y) = \text{input}(x,y) * (R0 + R1*\text{temp} + R2*\text{temp}*\text{temp})$$

5. Finally, the result is (optionally) converted to integers using the RADIANCE\_OFFSET and RADIANCE\_SCALING\_FACTOR keywords:

$$\text{output}(x,y) = (\text{input}(x,y) - \text{RADIANCE_OFFSET}) / \text{RADIANCE_SCALING_FACTOR} + 0.5$$

Note that the engineering cameras were not well calibrated radiometrically. Specifically, only flat fields were obtained, not temperature coefficients. Since they are build-to-print copies of the MER engineering cameras, the MER temperature responsivity parameters are used. For MMM, no temperature compensation is applied by the MIPLRAD method.

### 5.2.1.3 “Disparity” RDR

A Disparity file contains 2 bands of 32-bit floating point numbers in the Band Sequential order (line, sample). Alternatively, line and sample may be stored in separate single-band files.

The parallax, or difference measured in pixels, between an object location in two individual images (typically the left and right images of a stereo pair) is called the “disparity”. Disparity files contain these disparity values in both the line and sample dimension for each pixel in the reference image. This reference image is traditionally the left image of a stereo pair, but could also be the right image. The geometry of the Disparity image is the same as the geometry of the reference image. This means that for any pixel in the reference image the disparity of the viewed point can be obtained from the same pixel location in the Disparity image.

There are three types of disparity. In the primary type (DS\*), the values in the Disparity image are the 1-based coordinates of the corresponding point in the non-reference image. Thus, the coordinates in the reference image are the same as the *coordinates* in the Disparity image, and the matching coordinates in the stereo partner image are the *values* in the Disparity image. Disparity values of 0.0 indicate no valid disparity exists, for example due to lack of overlap, correlation failure, or parallax occlusion. This value is reflected in the MISSING\_CONSTANT keyword. Such holes are rather common depending on the scene,

Disparity images can also be “delta” disparity (DD\*), which measures the relative offset between coordinates in the two images. This is what most imaging scientists mean by disparity. These products are not produced in the nominal pipeline, but can be produced as special products. Missing values are flagged by the value specified in MISSING\_CONSTANT, typically 0.0.

The third type is a “first-stage” disparity (DF\*). This is a by-product of the two-stage MIPL correlation procedure [Ref 30] and represents the intermediate step between stages. It contains coordinate values, as in the primary disparity.

For each of the three primary types, several kinds of file can be produced: normal, line, sample, raw, error metric, and grid. Not all kinds apply to all types.

Normal disparity files contain 2 bands of floating-point numbers in (line, sample) order using the Band Sequential format. The line and sample components may be stored in separate single-band files.

Raw files contain the results before doing left->right and right->left reconciliation. They should be considered an intermediate result.

Disparity error metric files contain information about the quality of the correlation match. The tools to create them have not yet been developed; they are listed here as a placeholder for future expansion. Thus the format has not yet been determined as of this writing.

Grid overlays are an aid to visualization that may be created on occasion. These files are single-band byte images showing how a regular grid is distorted by the disparity matches (which is itself an indication of the terrain).

#### **5.2.1.3.1 Stereo Pair Matching Method**

Inherent in the designed operation of the stereo cameras is time-synchronization in the acquisition of left and right images intended for stereo processing. So, the SCLK timestamps of the respective left and right image acquired as a stereo pair onboard will be used to automatically identify them as a stereo image pair during nominal ground data processing.

Occasionally, stereo pairs will need to be processed that were not acquired simultaneously. This could be due to a sequence error, or for special operations such as re-pointing the mast between frames or driving the rover (long-baseline stereo). These off-nominal stereo pairs will be identified manually during ops, and processed as necessary. The special processing flag will be used to identify these. Additionally, most will use the "Actual" linearization method rather than "Nominal".

#### **5.2.1.4 “XYZ” RDR**

An XYZ file contains 3 bands of 32-bit floating point numbers in the Band Sequential order. Alternatively, X, Y and Z may be stored in separate single-band files as a X Component RDR, Y Component RDR and Z Component RDR, respectively. The single component RDRs are implicitly the same as the XYZ file, which is described below. XYZ locations in all coordinate frames for MSL are expressed in meters unless otherwise noted.

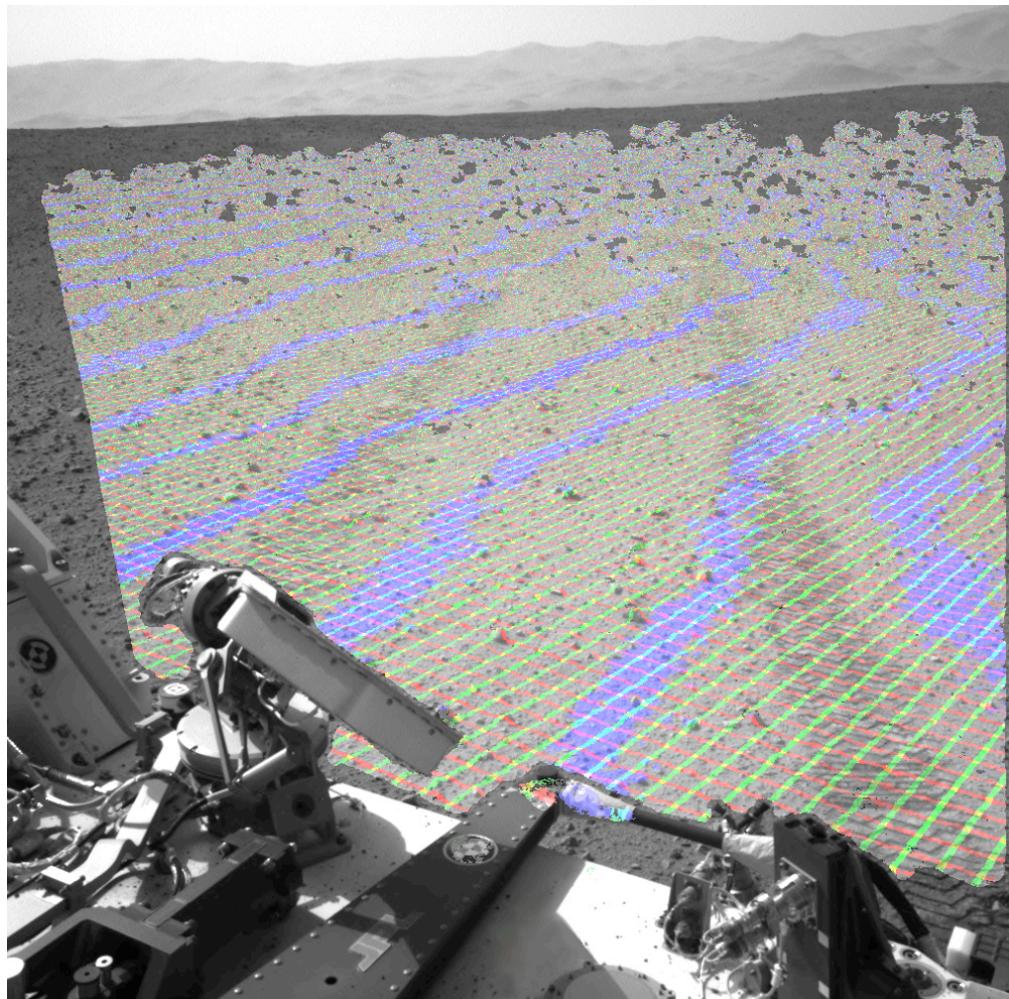

The pixels in an XYZ image are coordinates in 3-D space of the corresponding pixel in the reference image. This reference image is traditionally the left image of a stereo pair, but could be the right image as well. The geometry of the XYZ image is the same as the geometry of the reference image. This means that for any pixel in the reference image the 3-D position of the viewed point can be obtained from the same pixel location in the XYZ image. The 3-D points can be referenced to any of the MSL coordinate systems (specified by DERIVED\_IMAGE\_PARMS Group in the PDS label).

Most XYZ images will contain "holes", or pixels for which no XYZ value exists. These are caused by many factors such as differences in overlap, correlation failures, and the failure of a result to meet quality checks in the XYZ program. Realize this list of factors is only representative, and not exhaustive. Holes are indicated by X, Y, and Z all having the same specific value. This value is defined by the MISSING\_CONSTANT keyword in the IMAGE object. For the XYZ RDR, this value is (0.0,0.0,0.0), meaning that all three bands must be zero (if only one or two bands are zero, that does not indicate missing data). Note that "0.0,0.0,0.0" is technically a legal value, but could occur at most once in an image and will rarely occur at all. The value is based on legacy software from previous missions and is compatible with current mission software. Additionally, it is extremely unlikely that the value will conflict with actual data since it is between the rover's wheels in Rover Frame (which cannot be imaged in stereo except for heroic MAHLI efforts); even when the Site origin is visible (e.g.

the rover moves away), the possibility of sampling an exact value of “0.0,0.0,0.0” is considered extremely low. Also, if the value were to be sampled as actual data, losing a single pixel in the image is not problematic. The file format does not support nulls, so some other sentinel value would have to be chosen instead.

An XYZ Error metric (XYE) is available, which gives the estimated error for each pixel. It is a 3-band float product, with the three bands indicating the estimated range error (in meters) along each of the X, Y and Z axes. These values together define the error ellipsoid. Note that these values are axis-aligned, while the error is naturally range-aligned. Therefore the Range Error (RNE) product will generally be more accurate. XYE is provided as a convenience and its ellipsoid will always completely contain the RNE ellipsoid.

XYZ files can be filled (XYA). Individual X,Y,Z files can be filled as well. They can have associated rover mask files (MXY) as well as becoming masked (XYM) and saved as an overlay (XYO for XYZ, ZZO for Z-band), as shown in Figure 5.2.1.4 below. The rover mask files are discussed in more detail in Section 5.2.1.4.1.

**Figure 5.2.1.4 - XYZ Data Masked and Overlaid onto Image EDR**

#### 5.2.1.4.1 Rover Mask RDR

The MXY (mask for XYZ) file is a special kind of mask file, called a rover mask. This file is intended to mask off the rover, so that XYZ points correlated on the rover do not show up in terrains. It is created using a low-fidelity volumetric model of the rover (with some margin around the rover components), which is articulated based on the telemetered joint positions of the arm, wheels, and suspension. This model is then projected into the image to create a mask. The articulation means the mask will reflect the arm and wheel positions, minimizing the amount of good terrain that is masked off. If joint positions are not available, a "swept volume" is used, meaning the mask covers all possible positions of the articulating device. The HGA is always modeled as a swept volume.

Rover masks can also be generated using predicted arm joint positions; this is the basis of the "chemcam finder" mosaics produced during operations. Such predicted-state masks are marked using the special processing flag field in the filename.

Associated with the MXY mask image is an XML file with the same base name. This file contains a polygonal representation of the articulated low-resolution volumetric model that is used to make the rover mask (before it is projected into the image). The format of this file is not described completely here, but it is straightforward XML, consisting of a large number of polygons in XYZ space.

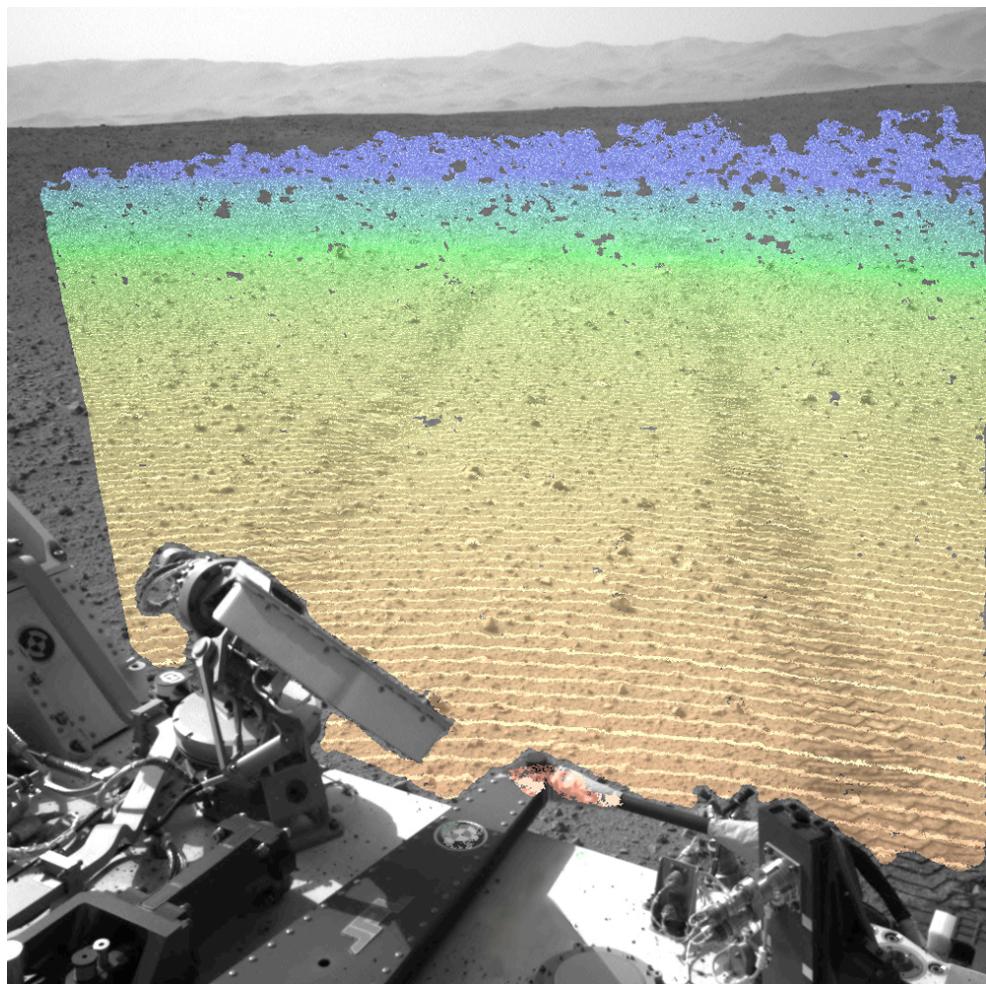

#### 5.2.1.5 “Range” RDR

A Range (distance) file contains 1 band of 32-bit floating point numbers.

The pixels in a Range image represent Cartesian distances from a reference point (defined by the RANGE\_ORIGIN\_VECTOR keyword in the PDS label) to the XYZ position of each pixel (see XYZ RDR). This reference point is normally the camera position as defined by the C point of the camera model. A Range image is derived from an XYZ image and shares the same pixel geometry and XYZ coordinate system. As with XYZ images, range images can contain holes, defined by MISSING\_CONSTANT. For MSL, this value is 0.0.

The Range Error metric (RNE) gives the estimated error of the XYZ point in meters for each pixel. Like XYE, it is a 3-band float product, whose three bands define the error ellipsoid (in meters). However, for RNE the bands are interpreted differently, in a way that more naturally represents the underlying error mechanism. The first band is the error in the downrange direction - radially away from the camera. This is the primary error for any stereo ranging system. The other two bands contain the cross-range error, orthogonal to each other and to the downrange vector direction. Band 2 (first crossrange) is coplanar with the camera stereo baseline and as such can generally be thought of as the "horizontal" crossrange direction, with band 3 the vertical, for common stereo geometries.

Range products can become masked (RNM), as well as filled (RNA) and overlaid (RNO), as shown in Figure 5.2.1.5 below.

**Figure 5.2.1.5 - Range (Distance) Data Overlaid onto Image EDR**

### 5.2.1.6 “Surface Normal” (UVW) RDR

A Surface Normal (UVW) file contains 3 bands of 32-bit floating point numbers in the Band Sequential order. Alternatively, U, V and W may be stored in separate single-band files as a U Component RDR, V Component RDR and W Component RDR, respectively. The single component RDRs are implicitly the same as the UVW file, which is described below.

The pixels in a UVW image correspond to the pixels in an XYZ file, with the same image geometry. However, the pixels are interpreted as a unit vector representing the normal to the surface at the point represented by the pixel. U contains the X component of the vector, V the Y component, and W the Z component. The vector is defined to point out of the surface (e.g. upwards for a flat ground). The unit vector can be referenced to any of the MSL coordinate systems (specified by the DERIVED\_IMAGE\_PARAMS Group in the PDS label).

Most UVW images will contain "holes", or pixels for which no UVW value exists. These are caused by many factors such as differences in overlap, correlation failures, and insufficient neighbors to compute a surface normal. Holes are indicated by U, V, and W all having the same specific value, defined by MISSING\_CONSTANT as (0.0,0.0,0.0).

Two special kinds of surface normal products are defined based on MER experience. These are not expected to be used during nominal MSL ops, but are included in case they become needed. The UVP type projects the surface normal onto an arbitrary plane in space, so the unit vectors always lie parallel to the plane. The UVT type provides the angle between the surface normal and the same arbitrary plane in a single band.

The UVW product contains the surface normal resulting from analyzing a small patch of pixels, which is appropriate for arm work. In contrast, the UVS product contains the surface normal resulting from analyzing a much larger patch of pixels (comparable to the size of the rover), which is appropriate for driving slope determination. Specific patch sizes are operational tuning parameters which have not yet been set, but will be provided in the history portion of the embedded VICAR label.

Surface normals can be filled (UVA) and overlaid (UVO). Separate U,V,W files can also be filled.

### 5.2.1.7 “Surface Roughness” RDR

The roughness maps, RUD (for the Drill) and RUT (for the Dust Removal Tool (DRT)) contain surface roughness estimates at each pixel in the image, along with a "goodness" flag indicating whether the roughness meets certain criteria.

For each pixel, the surface normal defines a reference plane. XYZ pixels in the area of interest are gathered, and the distance to the plane is computed. Outliers are thrown out. For the remainders, the minimum and maximum distances from the plane are found. Roughness is defined as the distance between this min and max (thus, is peak-to-peak variation within the area along the normal vector).

Two roughnesses are potentially computed. The first is an overall measurement containing all points within a radius of the central pixel. This is used for the DRT, and for the drill body. The second, used only for the drill, contains points within a ring between two radii. This is used for the drill stabilizer bars, and is not used for the DRT.

In each case, the computed roughnesses are compared to thresholds, which determine whether the point is "good" or not. The potential values of this goodness state are:

- 0.0 = No solution
- 1.0 = Both ring and overall roughnesses exceed thresholds
- 2.0 = Overall roughness (only) exceeds its threshold
- 3.0 = Ring roughness (only) exceeds its threshold
- 4.0 = Roughnesses within threshold (i.e. point is good)

Values of 1.0 and 3.0 appear only in the RUD product, since there is no ring for RUT.

The files are thus 2-band (RUT) or 3-band (RUD) float images, with the first band being the state, the second band being the overall roughness, and the third band being the ring roughness. For the second and third bands, 0.0 does not indicate a missing value (unlike most other products). Rather, 1.0 is used, as specified in MISSING\_CONSTANT.

The default parameters and thresholds for these products are shown in Table 5.2.1.7 (all values in meters):

**Table 5.2.1.7 - Surface Roughness Params and Thresholds**

Param / Threshold	Product Type	
	RUD	RUT
Overall radius	0.075 m	0.035 m
Overall threshold	0.04 m	0.005 m
Ring inner radius	0.06 m	n/a
Ring outer radius	0.075 m	n/a
Ring threshold	0.015 m	n/a

### 5.2.1.8 Slope RDRs

The Slope-related RDRs represent aspects of the slope of the terrain as determined by stereo imaging. The Slope Map is derived from the UVS product, which contains the rover-sized surface normal at every point. There are several slope types, each of which can additionally be overlaid on a background.

In the equations below,  $u$ ,  $v$ , and  $w$  are values from the UVS file, while  $x$ ,  $y$ , and  $z$  are values from the XYZ file.

#### 5.2.1.8.1 “Slope” (nominal) RDR

The SLP (SLO) type contains the slope in degrees for each pixel.

$$\text{slope} = \frac{180}{\pi} \left( \frac{\pi}{2} + \tan^{-1} \left( \frac{w}{\sqrt{u^2 + v^2}} \right) \right)$$

#### 5.2.1.8.2 “Slope Rover Direction” RDR

The SRD (SRO) type contains the component of the slope (in degrees) that was facing the rover, i.e. if the rover went radially outward from its current position, this indicates the climb or descent. In the formula below,  $\mathbf{R}$  is the rover's position.

$$\mathbf{V} = \frac{[x - \mathbf{R}_x \quad y - \mathbf{R}_y]}{\sqrt{(x - \mathbf{R}_x)^2 + (y - \mathbf{R}_y)^2}}$$

$$\text{srd} = -\frac{180}{\pi} \tan^{-1} \left( \frac{\mathbf{V}_x u + \mathbf{V}_y v}{-w} \right)$$

#### 5.2.1.8.3 “Slope Heading” RDR

The SHD (SHO) type contains the direction of the slope as a clockwise angle from north, in degrees. Use the 4-quadrant form of arctangent to get a full 360-degree range.

$$\text{slope\_heading} = \frac{180}{\pi} \tan^{-1}\left(\frac{\nu}{\mu}\right)$$

#### 5.2.1.8.4 “Slope Magnitude” RDR

The SMG (SMO) type contains the magnitude of the normal unit vector projected onto the horizontal plane. It is directly related to  $\sin(\text{slope})$ .

$$\text{slope_mag} = \sqrt{\mu^2 + \nu^2}$$

#### 5.2.1.8.5 “Slope Northerly Tilt” RDR

The SNT (SNO) type contains the component of the slope in degrees that points north.

$$\text{northerly_tilt} = \frac{180}{\pi} \sin^{-1}(\mu)$$

#### 5.2.1.8.6 “Solar Energy” RDR

The SEP (SEO) type is included as a placeholder. It is not used for MSL.

### 5.2.1.9 Arm Reachability RDRs

The Arm Reachability maps contain information about whether or not the instruments on the Arm can “reach” (contact or image) the object or location represented by each pixel in the scene, and how hard they can push (“preload”). They are derived from the XYZ and Surface Normal (UVW) products.

The geometry of the reachability maps match the reference XYZ, and Surface Normal (UVW) images, in that each pixel in the file directly corresponds to the pixel at the same location in the other products.

For the arm reachability map products, pixels with a DN of 0 denote an area where an arm instrument is unable to make contact (see Tables 5.2.1.9.1.1 and 5.2.1.9.1.2). To avoid ambiguity in the operational data store and archive, all arm reachability products are generated and archived, regardless of whether the reachability values are 0 or not. Consequently, there are arm reachability products comprised entirely of pixels with DN 0, that is, with no pixels indicating reachability. These products help document the decision process employed by the MSL project when identifying contact science targets.

#### 5.2.1.9.1 “Arm Reachability” RDR

The reachability map (ARM) encodes information for each of the 5 arm instruments in each of the 8 possible arm configurations, for a total 40 values per pixel. It is stored as a 5-band image of 16-bit integers in standard Band Sequential order. Each band represents one of the 5 arm instruments in the order defined by INSTRUMENT\_BAND\_ID. Within each band, the 16-bit integer contains 2 bits of information for each of the 8 configurations (in the order defined by CONFIGURATION\_BIT\_ID) packed into the 16-bit value. The first mode in CONFIGURATION\_BIT\_ID is in the high-order 2 bits of the integer. The two bits represent 4 states: not reachable (0), and three levels of reachability, with 3 being the most easily reachable. Reachability is determined by checking if the contact,

approach, and overdrive positions are reachable using the computed surface normal and 3 additional normals differing by a "tweak" angle from the computed one. Reachability level 3 indicates all checks pass, while 1 and 2 indicate that some did not and may require extra attention from the arm operator in order for the instrument to safely reach the point.

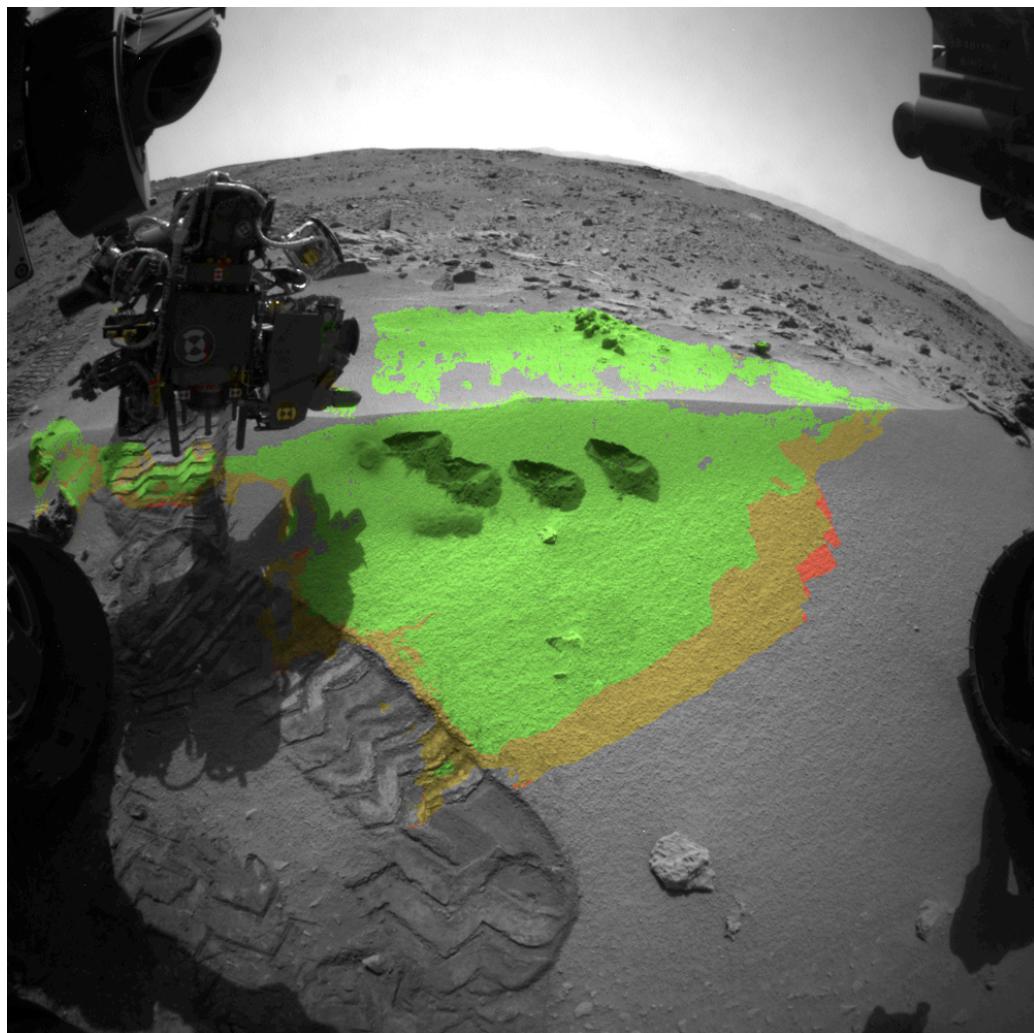

**Table 5.2.1.9.1.1 - Arm Reachability Bit Assignments Per Configuration**

16-bit Integer Bit Order (15=MSB, 0=LSB)							
15 - 14	13 - 12	11 - 10	9 - 8	7 - 6	5 - 4	3 - 2	1 - 0
Shoulder Out, Elbow Up, Wrist Up	Shoulder Out, Elbow Up, Wrist Down	Shoulder Out, Elbow Down, Wrist Up	Shoulder Out, Elbow Down, Wrist Down	Shoulder In, Elbow Up, Wrist Up	Shoulder In, Elbow Up, Wrist Down	Shoulder In, Elbow Down, Wrist Up	Shoulder In, Elbow Down, Wrist Down

**Table 5.2.1.9.1.2 - Arm Reachability Values**

Value		Description
Decimal	Binary	
0	00	Not reachable
1	01	Reachability quality 1
2	10	Reachability quality 2
3	11	Reachability quality 3 (best)

Note that reachability maps may include masks (MAR), be masked (ARK), and be overlaid (ARO) as shown in Figure 5.2.1.9.1 below.

**Figure 5.2.1.9.1 - Arm Reachability Qualities Color-coded, Overlaid onto Image EDR**

### 5.2.1.9.2 “Arm Preload” RDR

The ARP type indicates the minimum and maximum preload values (in Newtons) that can be applied by the Drill instrument at the point represented by the pixel. This is a 2-band 16-bit signed integer products, where the bands represent (minimum, maximum) preloads (also defined by INSTRUMENT\_BAND\_ID).

### 5.2.1.10 Color RDRs

The MMM cameras contain a Bayer pattern of color filters on the CCD. This is a repeating pattern of 4 pixels where each “cell” contains one red, two green, and one blue pixel (see Figure 4.3.3.1). This allows acquisition of color without using the filter wheel. In order to be generally useful, the image must normally be “de-Bayered” in one of several ways. The method of de-Bayering is indicated by the “config” field in the product filename, with additional support from the “samp” field. Any time de-Bayering results in an image size change, the camera model must be adjusted to match.

For color images, the Bayer cells are typically extracted to separate color bands. This is indicated by values of “R”, “G”, or “B” for the “config” field. If the image is half-size in both dimensions as compared to the original (e.g. the RGB cells are simply extracted), then the “samp” field displays “B” to indicate Bayer subsampling. If the pixels are interpolated back to full size, the “samp” field is unchanged. Green pixels, being twice as numerous, present special challenges. For a full-size image, the “config” code is “G”. For Bayer-subsampled images, several cases are possible. If only the upper or lower green pixels are used from each cell, then the “config” values are “U” or “L”. If both are combined, the value is “G”. If both are present, so the image is twice as big in one dimension than the other, the value is “D”. Regardless of the extraction mode, if all three colors are merged back into a single 3-band image, the value is “F”, with the “samp” field indicating the size.

For non-color images taken using geology filters, there are two additional options. Individual cells can be extracted as described above. They can also be averaged in a 2x2 pattern (potentially taking into account responsivity of the filter) to create one pixel per Bayer cell. This is indicated with a “config” value of “A”. Or, each pixel can be corrected for the combined responsivity of the Bayer and geology filters; this is indicated with a value of “C”.

Note that most de-Bayering is done onboard. This is not reflected using the “config” code. 2x2 averaging or subsampling simply results in a downsampled or subsampled image, while JPEG creation results in a single 3-band EDR image. Thus for all EDRs, the “config” field represents the filter number, not the Bayer state.

### **5.2.1.11 “Photometry” RDR**

The IEP type contains incidence, emission, and phase angles for each pixel for use in photometry work. It is a 3-band float product derived from UVW in the order (incidence, emission, phase). It can also be filled (IEA).

### **5.2.1.12 Terrain Map RDRs**

Terrain models are high level products which are derived using XYZ files and the corresponding image files. The XYZ files contain point clouds: sets of vertices in a specific coordinate system. The corresponding image files are used to obtain intensity or color information for each vertex in the point cloud. The terrain models are generated by triangulating point clouds using volume based surface extraction. The original image is used as a texture map to add detail and color to the polygonal surface representation. Terrain models are stored in Open Inventor binary format. Image textures are stored in SGI RGB format. Height maps (i.e., digital elevation maps, or DEMs) are also produced and used by the Rover Sequencing and Visualization Program (RSVP) for tasks which require simple and fast lookup such as rover settling. Height Maps are stored in VICAR format.

#### **5.2.1.12.1 “Per-XYZ” Terrain RDRs**

For every XYZ RDR created, the following terrain products are generated and follow the Single-frame RDR filename convention (see Section 6.1.1):

- a) (\*.tar) - A collection of tiles representing spatial subdivision of a point cloud. Each tile is a separate file within the tar-file. Each tile contains vertices that defines terrain in multiple Level of Details (LOD). From the vertices, triangles are striped for rendering efficiency. Note that tar-files are not used for unified mesh creation and though self-contained, serve only as intermediate products.
- b) (\*.iv) - Open Inventor terrain representation of a point cloud defined in the XYZ RDR. It's a single file generated by combining all tiles contained in the tar-file described above and storing it as an Open Inventor binary file. It constitutes the per-XYZ mesh product.

- c) (\*.rgb) - Image file in SGI RGB format that is used as the Texture Map for the per-XYZ mesh product.
- d) (\*.ht) - Height Map (DEM) derived from the XYZ RDR, stored as an image file. It's in VICAR format but is not fully compliant to VICAR label specifications. It has 3 bands. Band 1 contains actual height data. Band 2 fills areas for which there is no actual data using interpolation. Band 3 provides metric of how close a pixel value is to the actual data.

Example:

Given the point cloud XYZ RDR named NLA\_412403715XYZLF0060000NCAM15000M1.IMG and the corresponding image NLA\_412403715RASLF0060000NCAM15000M1.IMG, the following files are created:

- NLA\_412403715RASLF0060000NCAM15000M1.tar - Collection of vertices tiles in Open Inventor ASCII format representing spatial subdivision of the point cloud.
- NLA\_412403715RASLF0060000NCAM15000M1.iv - Concatenation of all tiles into one Open Inventor file in binary format.
- NLA\_412403715RASLF0060000NCAM15000M1.rgb - Texture Map image in SGI image format.
- NLA\_412403715RASLF0060000NCAM15000M1.ht - Height Map image, with the following label items defining the spatial extent of the Height Map:

NL = 512	(number of lines)
NS = 442	(number of samples)
X_AXIS_MINIMUM = -39.906654	
Y_AXIS_MINIMUM = -8.1579	
MAP_SCALE = 0.087151	(Resolution at which Height Map has been generated)

### **5.2.1.12.2 “Unified” Terrain RDRs**

Just as individual images can be combined into image mosaics, per-XYZ meshes can be combined into unified terrain meshes. These are the ultimate terrain products used by rover planners during tactical operations. Per-XYZ polygonal surfaces are generated using XYZ RDRs defined in a Site frame. The tool RSVP extracts Site information from the unified mesh product filename to render terrains into the proper locations for rover traverse and arm placement applications, as shown in Figures 5.2.1.12.2.1 and 5.2.1.12.2.2.

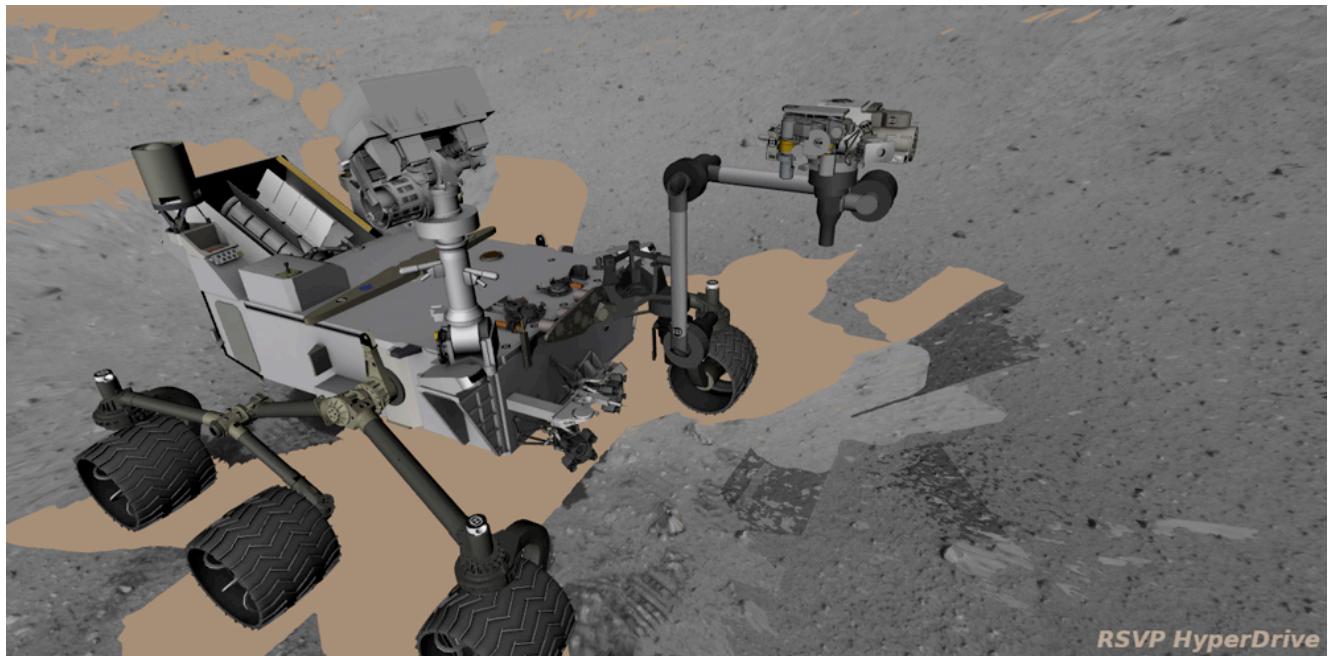

The terrain products listed below follow the unified mesh product filename convention (see Section 6.1.3), which differs from the Single-frame filenames carried by the per-XYZ terrain products:

- a) (\*.iv) - Open Inventor file in ASCII format that contains references to all individual binary per-XYZ Open Inventor files
- b) (\*.mod) - ASCII file that contains references to all corresponding individual per-XYZ “.ht” Height Maps files.

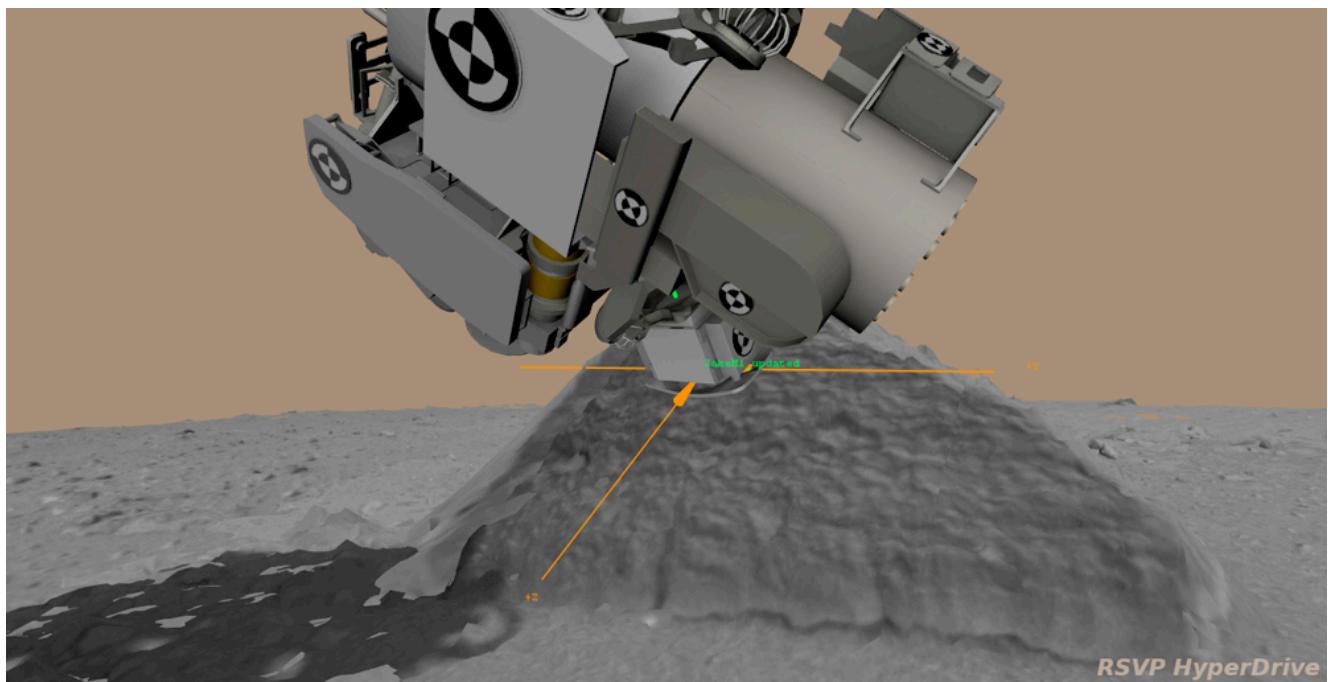

Example:

Assuming the generation of multiple per-XYZ mesh products described and exemplified in Section 5.2.1.12.1, the following unified mesh files are created:

- N\_L0168\_RASLF\_006\_0000\_AUTOGENM1.iv - Collection of references to Open Inventor files including NLA\_412403715RASLF0060000NCAM15000M1.iv
- N\_L0168\_RASLF\_006\_0000\_AUTOGENM1.mod - Collection of references to Height Maps including N\_L0168\_RASLF\_006\_0000\_AUTOGENM1.ht

**Figure 5.2.1.12.2.1 - Rover Location Rendered in Unified Terrain Mesh**

**Figure 5.2.1.12.2.2 - Arm Payload Location Rendered in Unified Terrain Mesh**

### 5.2.1.13 Mosaic RDRs

This section discusses the process of mosaicking multiple frames into a single RDR product using some projection. The text largely reflects the methods applied by MIPL under OPGS. It should be noted that governing methods and software can differ between OPGS and other operations subsystems or science instrument teams; the algorithms followed by other teams may not be the same as described here.

#### 5.2.1.13.1 Overview of Mosaics in General

Mosaics can embody several important properties, making them very useful products. They assemble small pieces into a larger field of view. Certain projections create a level horizon, removing rover tilt. Mosaics can be calibrated so directions such as north and east can be determined - or they can be made relative to the rover to visualize forward and right. They can provide overhead views (Vertical, Polar, or Orthorectified projections) to help understand the local environment. They can be made from different types of data (such as slope). They can combine different filters to create color. Finally, they are the signature products for public outreach.

Mosaics can be assembled autonomously by tracing a view ray from each mosaic location or pixel into the scene, determining its intersection with a surface model (typically a ground plane), and then querying each input image to determine if that point lies within its field of view. In this fashion mosaics containing perhaps hundreds of images can be assembled for each spectral band. It may be necessary to refine the camera pointing in order to produce accurate mosaics. This requires the determination of the actual azimuth and elevation of each image in order to correct for errors such as gear backlash. One way to do this is to acquire tiepoints between all pairs of overlapping images. Camera pointing parameters are then estimated which cause the camera model to map the tiepoints to their correct locations. In many cases this can be accomplished automatically, but it often requires human intervention to select tiepoints because of small overlap, parallax, or changing lighting.

#### 5.2.1.13.2 Mosaicking Method

The process used by the MIPL software to create mosaics is described below. It consists of several sub-steps. Conceptually, one can think of the process as adjusting the pointing of the inputs, projecting them down to a surface, and looking at the result from a different point of view (the output projection). In reality, the process is run in reverse for ease of interpolation (this is described below).

- A. **Pointing Correction** - An optional (but important) first step in mosaic production is pointing correction. This is used to minimize geometric seams (discontinuities) between frames. The results of pointing correction are used in mosaics, but they can also be fed back into the RDRs (often at the ILUT stage), resulting in adjusted XYZ and other derived values and corrected meshes.

There are several methods by which improved pointing of the cameras can be determined. The most common method is to pick tiepoints between image pairs, either automatically or with manual assistance, and use those in a global cost function minimization to determine the corrected pointing parameters. Another possibility is to analyze the shape of XYZ data in the overlap region, again using an error minimization process to derive updated pointing parameters. Pointing parameters can also be determined manually.

Regardless of method, the result is encapsulated in a pointing correction or "nav" file. A more detailed description of this file is provided in Section 5.2.1.13.3, but fundamentally, this file

contains, for each image being corrected, the original pointing parameters and the revised pointing parameters.

Pointing parameters are simply those numbers which represent how the camera is pointing in the rover frame, reduced to available degrees of freedom. These are used as inputs to the kinematics procedures which derive the camera model. The set of pointing parameters, together with the kinematics algorithm, is referred to as a pointing model. The job of a pointing model is to take a calibration camera model and transform it using the pointing parameters to create a transformed camera model which represents the specific image in question.

A given camera may have multiple available types of pointing models. The mast-mounted cameras have a standard model with two parameters: azimuth and elevation actuator angles. However, another model is available with three: azimuth, elevation, and “twist”, which is a rotation around the camera’s A axis (A being one of the CAHV camera model parameters). For MAHLI, there are two models: one with six parameters (the XYZ position plus the three Euler angles describing the orientation) and one with seven (XYZ plus the four components of a quaternion). The Hazcam and MARDI models have zero parameters, since they are rigidly attached to the rover body. Other pointing models may exist as well.

The set of available pointing model types and their full descriptions are outside the scope of this SIS; they are defined in a PDS documentation file.

For the mosaic process, the “nav” file is sufficient to describe the pointing parameters. However, if other corrected RDRs need to be produced, such as XYZs or meshes, then the pointing parameters must be stored in the label. This is accomplished via the POINTING\_MODEL\_NAME and POINTING\_MODEL\_PARAMS labels. When recomputing a camera model, if these labels are present they should be used in preference to the normal method of pointing via labels in the ARTICULATION\_DEVICE\_STATE groups. For most users, however, the GEOMETRIC\_CAMERA\_MODEL should be used directly; this will be updated properly with respect to the corrected pointing.

- B. ***Output Projection Determination*** - The output projection is then determined. The parameters describing the projection are listed in Appendix A, and described in detail in Appendix F. The output projection parameters are determined by analysis of the inputs to give the "best" resulting mosaic, but can be overridden by the user. The determination process is outside the scope of this document; the results are what is important and they are in the label.
- C. ***Surface Determination*** - A surface model is critical for mosaics. This is a mathematical surface, which approximates the actual scene. To the extent that the scene differs from the surface model, distortion and uncorrectable seams due to parallax can result.

Usually the surface model is a flat plane, with normal pointing upwards. This can be adjusted, however, to better match the scene. Regardless, the results are documented in the SURFACE\_MODEL\_PARMS group.

There are five potential surface models in the MIPL software: PLANE, INFINITY, SPHERE, SPHERE1, and SPHERE2. See SURFACE\_MODEL\_TYPE in Appendix F for description. Note that an appropriate surface model is often determined automatically as part of the pointing correction process, and the surface model can be stored in the “nav” file. Almost all mosaics are created using the PLANE model.

Note that the parameters (surface normal and ground point, for PLANE) for an appropriate surface model are often determined automatically as part of the pointing correction process, and the surface model can be stored in the "nav" file.

- D. **Computation of Output View Ray** - For each pixel in the output mosaic, a view ray in 3-D space is constructed. How this view ray is constructed depends on the projection type. In this section, the pixel is at location (i,j) in 0-based coordinates, with i corresponding to sample and j to line. (0,0) is in the upper-left-hand corner. Capitalized values represent PDS label items from the SURFACE\_PROJECTION\_PARMS group. Unit and coordinate system conversions are applied as necessary but are not specified here. The coordinate system used is defined by REFERENCE\_COORD\_SYSTEM\_\* in SURFACE\_PROJECTION\_PARMS.
- E. **Projection from Output to Surface** - Once the view ray is determined, it is projected out until it intersects with the surface model. The resulting point in XYZ space is used in the next step. If the ray does not intersect the surface, the point is assumed to be at infinity in the direction the view ray is pointing. Exception: as mentioned below, the Vertical projection will reverse the direction of its view ray; infinity is assumed only if they both miss.

Note that the INFINITY surface model guarantees the ray will miss the surface at all times.

The difference between the SPHERE1 and SPHERE2 models is that, if the ray intersects the spherical surface more than once, SPHERE1 will take the first intersection, while SPHERE2 will take the second. For normal rover situations, SPHERE1 thus roughly models a convex hill, while SPHERE2 roughly models a concave crater when the rover is outside the sphere.

- F. **Projection from Surface to Input** - The XYZ location (or direction for the infinity case) is then back-projected into each input camera model in turn, using the corresponding input camera model. The first input for which the resulting pixel coordinate is inside the image (excluding border pixels which are thrown away) and non-0 stops the process; that is the image from which the output pixel value is taken. Values of 0 in the input image are ignored, with the effect that they are transparent.

This process results in stacking the images such that the first one in the input list of images "wins". There is no feathering of overlaps; the first image is "on top" of all the others, and an image completely covered by preceding images will not be used at all.

- G. **Interpolation and Storage of the Result** - Finally, a bilinear interpolation is performed on the input image, based on the 4 pixels surrounding the back-projected location. The result of this interpolation is the value of the output pixel.

Bilinear interpolation is optional, but is normally done for image mosaics. Mosaics of other data types such as XYZ or Surface Normal (UVW) generally have interpolation turned off to avoid aliasing from interpolation with invalid pixels.

#### 5.2.1.13.3 Mosaic Ancillary Files

A number of ancillary files are used to support mosaicking, and contain parameters and information describing how the mosaic was produced. With these, it is possible to maintain traceability and provenance for each pixel in a standard mosaic back to the source image. On PDS-released archive volumes, the ancillary files have the same basename as the mosaic to preserve one-to-one matching with the mosaic, albeit with a different extension. On the operational data store (ODS) for operations,

they might not necessarily have the same mosaic basename, as several mosaics might share an ancillary file. In such cases, the ancillary file's name may indicate a different product type, projection, eye, filter/color, or geometric or brightness correction than the target mosaic's filename. The other filename fields should always match.

It should be noted that many if not most mosaics are produced at least partially by hand, which explains most of the inconsistencies noted below. The general case is described, but as with any hand work not all conforms exactly.

These files are not described completely here, but we hope the descriptions are sufficient to be able to decipher them:

- a) **List files** - With a ".LIS" extension, list files are simple text files containing the names of the images making up the mosaic, one per line. The first name in the list references the image frame that is "on top" in the mosaic product, covering the image frames that are referenced in the list below it. The list files often contain full pathnames to disks on the operational data store (ODS), directory paths which are not part of a PDS-released archive volume. However, the filenames themselves, minus directory paths, usually will be part of an archive volume. Occasional mosaics may have list files comprised of names for private copies of images (e.g. with "/home" in the pathname) that are the result of different scenarios of special processing: specified and unspecified. In the former case, such image files will be in an archive volume with filenames that carry a character flagging the type of special processing. In the latter case, no special character is present in the filename, though the file's name and/or metadata label will identify the ultimate source image of the unspecified processing. Note that a mosaic's list file content of filenames (minus directory paths) is also referenced in the mosaic's label using keyword INPUT\_PRODUCT\_ID.
- b) **Nav files** - With a ".NAV" extension, nav files are XML files describing the pointing corrections that have been applied to images in a mosaic, as well as the surface model. The prologue contains identifying information. Note that the "static\_parameters" file is listed as "MSL:MSL\_pma.point" in some nav files; this should be corrected to "MSL:MSL\_mast.point" and refers to the calibration file used to find mast kinematics parameters.

Pointing correction works by applying a set of pointing parameters (e.g. mast azimuth and elevation) to a kinematics algorithm and using that to re-point the camera model. See definition of keyword POINTING\_MODEL\_NAME in Appendix F for more information.

For each image (<solution> element), the Site and Drive components of the RMC are listed, followed by image identifier information. This identifier information contains the original pointing parameters, which allows the same correction to be applied to e.g. the left and right eyes (irregardless of image ID information).

Following that are the updated pointing parameters, and then the revised (re-pointed) camera model. In rare cases, nav files are edited by hand, which puts the accuracy of the camera model update at risk.

At the end is usually a "surface\_model" element describing the surface model determined by the MIPL software program MARSNAV (which creates the nav files). This information is repeated in the SURFACE\_MODEL\_PARMS group of the mosaic product's label.

- c) **Tiepoint files** - With a ".TIE" or ".TPT" extension, tiepoint files are XML files containing image tiepoints used as input to program MARSNAV. These can be automatically or manually selected. The prologue relates each image ID to a key, which is used throughout the remainder of the file.

Each tiepoint has a left and right key, and then 1-based coordinates in the corresponding files of the tiepoint. Just <left> and <right> should be used; <projected> has little value. In the

flags, “quality” represents the quality of correlation match when the tiepoint was correlated (scale 0-1). The “interactive” flag has little archival value. It does not (as the name suggests) indicate whether the tiepoint was automatically selected or manually tweaked.

Tiepoint type “0” is by far the most common and is a standard image tiepoint. Other types are rarely used and their descriptions are beyond the scope of this document. Full descriptions are in the help documentation for program MARSNAV.

- d) **Brightness Correction files** - With a “.BRT” extension, brightness correction files are XML files containing information used to correct the brightness and contrast of images in a mosaic relative to one another. They are similar in concept and structure to nav files. After the prologue, each image has one `<brt_solution>`. The most common correction type, LINEAR, specifies an overall additive and multiplicative factor to be applied to each image (MULT is applied first, then ADD). These factors are echoed in the IMAGE\_RADIANCE\_FACTOR and IMAGE\_RADIANCE\_OFFSET keywords in the mosaic label. The HSI\_LIN type is similar, except the correction (for color images) is done in Hue-Saturation-Intensity (HSI) space, with the correction applied to Intensity only. See also BRIGHTNESS\_CORRECTION\_TYPE.
- e) **Brightness Overlap files** - With a “.OVR” extension, brightness overlap files are XML files containing information about image statistics in overlap areas, used to create the brightness correction files. They are similar in concept to tiepoint files, except the “tiepoints” are the mean and standard deviation of small areas of overlapping pixels for the mosaic.

They start with a prologue defining the image ID-to-key mapping, as with nav files. Each overlap then has a number of images involved in the overlap, the number of pixels, and a “radius” which is a general description of the maximum size of the overlap. This is followed by the key, mean and standard deviation of the overlapping area in each image. The line and sample coordinates are provided for an arbitrary point in the overlap, just to help locate where the overlap is. The actual shape of the overlap is not specified.

Overlap type “0” is a standard overlap. Type “1” gives the mean and standard deviation not of an overlap, but of the image as a whole (thus there is only one image). Type “2” is like type “0” but has mean and standard deviation in HSI space (intensity only). Type “3” is like type “1” but using HSI space. See the help documentation for MIPL software program MARSBRT for full details.

#### **5.2.1.13.4 “Cylindrical Projection Mosaic” RDR**

Cylindrical projections are the most common method for viewing non-stereo panoramas.

The MIPL method for creating a Cylindrical projection involves computing the azimuth and elevation of the view ray, as follows:

```
azimuth = i / MAP_RESOLUTION + START_AZIMUTH
elevation = (ZERO_ELEVATION_LINE - j) / MAP_RESOLUTION
```

The view ray emanates from the point PROJECTION\_ORIGIN\_VECTOR.

Figure 5.2.1.13.4 shows such a mosaic overlaid onto azimuth and elevation grid lines, with individual frame boundaries superimposed and annotated by number. In this case each pixel represents a fixed angle in azimuth and elevation. Rows are of constant elevation in the selected coordinate frame. In this case, a Site frame was used, so the horizon is level, and columns begin clockwise from Mars north.

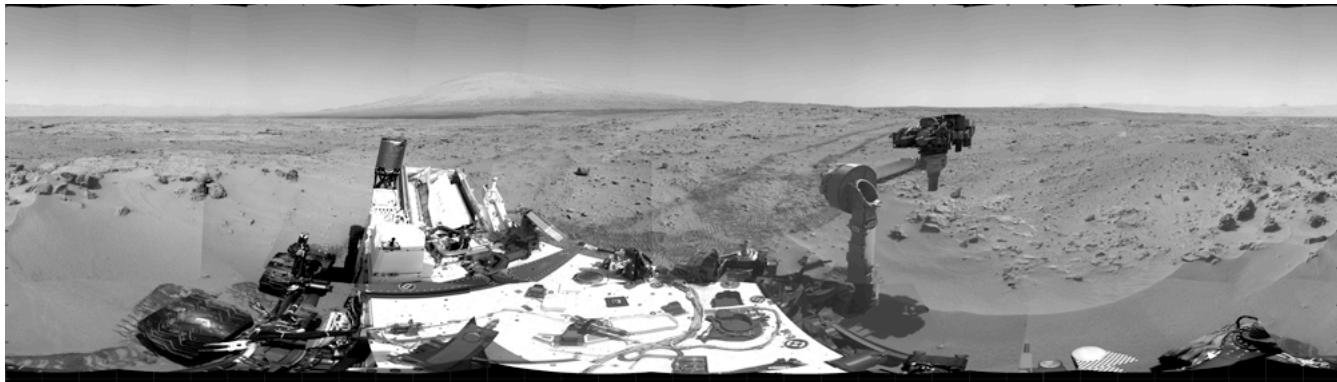

Figure 5.2.1.13.4 - Cylindrical Projection Mosaic

#### 5.2.1.13.5 “*Camera Point Perspective Mosaic*” RDR

Figure 5.2.1.13.5 shows a Camera Point Perspective mosaic. It is a perspective projection with horizontal epipolar lines. The mosaic behaves as though the "camera" which acquired the image frames was an instrument with a much larger field of view. For MSL, this type of mosaic is typically in the Rover Frame and thus may have a tilted horizon if the rover is not level.

Point-perspective mosaics give the most natural view of small areas and are suitable for stereo viewing, but cannot be used for wide fields of view.

MIP creates the Camera Point Perspective by using the output camera model (described by the GEOMETRIC\_CAMERA\_MODEL group in the output mosaic) to project the pixel into space. The origin of the view ray is thus the C point of the camera model, with the ray's direction being determined by the camera model. See Section 5.4.1 and references [Ref 18] through [Ref 27] for the mathematics.

**Figure 5.2.1.13.5 - Camera Point Perspective Mosaic**

#### **5.2.1.13.6 “Cylindrical-Perspective Projection Mosaic” RDR**

Cylindrical-Perspective mosaics are used for large stereo panoramas, and work across a full 360 degrees of azimuth. Stereo is preserved because a baseline separation is maintained between the camera eyes at different azimuths.

This projection is the most complicated projection to create. Each column  $i$  (counting from 0) in the output mosaic is assigned its own camera model. This is done in several steps:

- 1) Compute initial camera model. This model is a CAHV linearized model derived from the first input to the mosaic, re-pointed to azimuth 0 and elevation PROJECTION\_ELEVATION. This model is stored in the GEOMETRIC\_CAMERA\_MODEL label group.
- 2) The instantaneous field of view of the "central" pixel (at the point where the A vector intersects the image plane) is computed using the formula:

$$\text{ifov} = \text{atan}(1.0 / |(\vec{H} - \vec{A}) * (\vec{H} \cdot \vec{A}))|)$$

where the “•” indicates the scalar dot product of the two vectors A and H.

Alternatively, this can be derived from the image size and azimuthal extent (where the azimuths are adjusted by 360 degrees such that the result is minimally positive):

$$\text{ifov} = (\text{STOP\_AZIMUTH} - \text{START\_AZIMUTH}) / \text{LINE\_SAMPLES}$$

- 3) The azimuth of the column is computed:

$$\text{azimuth} = \text{START\_AZIMUTH} + i * \text{ifov}$$

- 4) The initial camera model is re-pointed using kinematics as described above under the pointing correction section, using the above azimuth and PROJECTION\_ELEVATION. This results in the final camera model for the column.

Step 4 is difficult to duplicate for reconstructing the set of camera models. For that reason, an alternate method is described in this paragraph. The resulting models are exact for mast-mounted cameras with no backlash correction; they are a close approximation for other cases. In general, for mast-mounted cameras, the C points of the column camera models describe a ring in space, whose diameter is approximately the baseline between the cameras. This ring is described by PROJECTION\_ORIGIN\_VECTOR (center), PROJECTION\_AXIS\_OFFSET (radius), and CAMERA\_ROTATION\_AXIS\_VECTOR (orientation of the ring axis). These together simulate the kinematics motion of a mast-mounted camera in Rover frame. To compute the camera model for the azimuth defined in Step 3, take the camera model from the label, and rotate the entire camera model around the camera rotation axis by the azimuth amount, using the ring center as the pivot point. The C point will remain on the ring, while the camera pointing (close to but not identical to the A vector) will remain approximately tangent to the ring at that point. After this, compute the rotation required to transform CAMERA\_ROTATION\_AXIS\_VECTOR into PROJECTION\_Z\_AXIS\_VECTOR (which can be done by taking the cross product to get the rotation axis and the dot product to get the rotation amount). Then rotate the camera model by this amount, again using the ring center as the pivot point. This has the effect of tilting the entire ring so it is perpendicular to the PROJECTION\_Z\_AXIS\_VECTOR. This last rotation is often used to remove the effect of rover tilt, resulting in a flat horizon with the camera model baselines (vector between the left and right eyes) aligned with the horizon (technically, perpendicular to the Z axis in Local Level frame). For this "untilt" case, the PROJECTION\_Z\_AXIS\_VECTOR is the Local Level frame's Z axis expressed in Rover Nav frame. Note that PROJECTION\_ELEVATION and PROJECTION\_LINE are measured before this "untilt" rotation takes place, so they end up describing a sinusoid in the final mosaic when untilt is used.

Once the camera models have been defined, the mosaic proceeds through each pixel as with the other projections. The view ray is computed as described below (A, H, and V come from the column's camera model):

$$\begin{aligned} x_{\text{center}} &= \overrightarrow{A} \cdot \overrightarrow{H} \\ y_{\text{center}} &= \overrightarrow{A} \cdot \overrightarrow{V} \\ \text{samp} &= x_{\text{center}} \\ \text{line} &= y_{\text{center}} + j - \text{PROJECTION\_ELEVATION\_LINE} \end{aligned}$$

where the “•” indicates the scalar dot product of two vectors. This (samp,line) coordinate is then projected into space using the column's camera model, and this projection becomes the view ray. The origin of the view ray is the column's C point. See Section 5.4.1 and references [Ref 18] through [Ref 27] for the mathematics of camera models.

Figure 5.2.1.13.6 shows a Cylindrical-Perspective projection in which a 360 degree view can be viewed in stereo. This is a perspective projection similar to Figure 5.2.1.13.5 except that the mosaic acts like a pinhole camera which follows the mosaic in azimuth while maintaining camera baseline separation. If the mosaic is generated with no tilt correction (i.e., CAMERA\_ROTATION\_AXIS\_VECTOR and PROJECTION\_Z\_AXIS\_VECTOR are the same) and the rover is tilted, the horizon will not be level, instead being sinusoidal. This preserves epipolar alignment and allows for better stereo viewing of the panorama. However, for aesthetic reasons, Cylindrical-Perspective mosaics are often created by “untilting” the rover as described above. In these cases, the horizon will be level, but stereo alignment may be compromised due to parallax effects in areas where the surface model does not closely match the actual surface. Additionally, the overall baseline between the cameras may be adjusted via the ring radius (PROJECTION\_AXIS\_OFFSET). This has the effect of enhancing or reducing the overall disparity, which can result in better stereo viewing in some cases. This baseline adjustment may create similar parallax effects in areas where the surface model does not match the actual surface.

**Figure 5.2.1.13.6 - Cylindrical-Perspective Projection Mosaic**

### 5.2.1.13.7 “Polar Projection Mosaic” RDR

Polar mosaics create a quasi-overhead view that still allows viewing all the way to the horizon.

MIP1 creates the Polar projection by computing the azimuth and elevation of the view ray as follows:

```

x = i - SAMPLE_PROJECTION_OFFSET
y = LINE_PROJECTION_OFFSET - j
range = sqrt(x*x + y*y)
elevation = range / MAP_RESOLUTION - 90 degrees
azimuth = REFERENCE_AZIMUTH + (90 degrees - atan2(y, x))
  
```

The view ray emanates from the point PROJECTION\_ORIGIN\_VECTOR.

Figure 5.2.1.13.7 shows a Polar projection. Concentric circles represent constant projected elevation. Mars nadir is at the convergent center and the horizon is corrected for lander tilt. North is up.

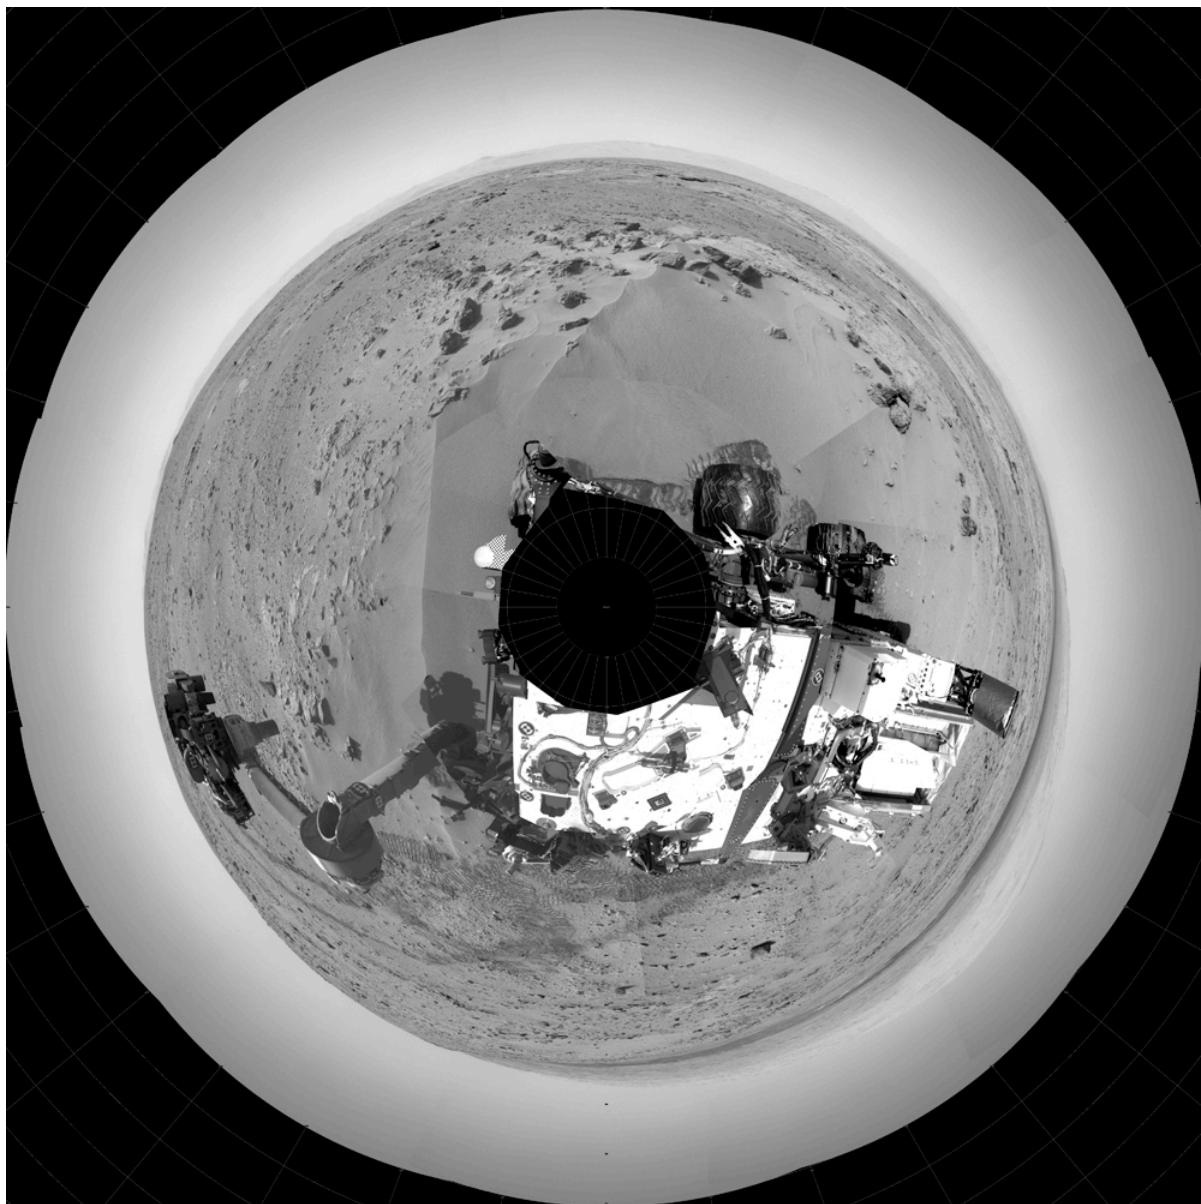

Figure 5.2.1.13.7 - Polar Projection Mosaic

#### 5.2.1.13.8 “Vertical Projection Mosaic” RDR

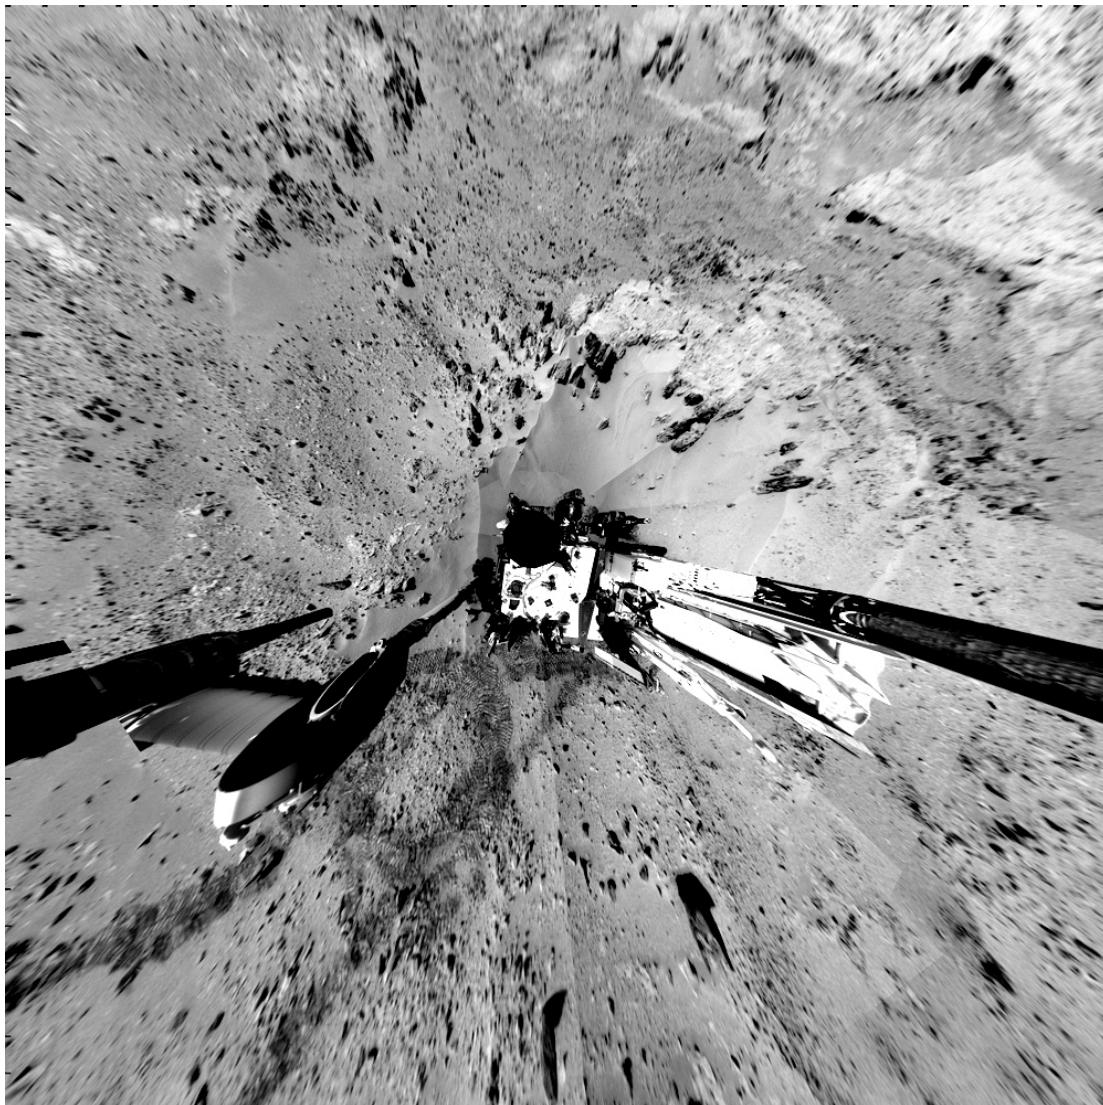

Vertical mosaics provide a view of the surroundings as if you were looking straight down. They are thus quite useful for establishing the environmental context or comparing with orbital imagery, but suffer from severe distortion with any variance of the scene from the surface model. In particular, rocks are severely elongated, and the terrain is not taken into account.

M IPL creates the Vertical projection as follows:

nl = number of lines in the mosaic (IMAGE object, LINES)  
ns = number of samples in the mosaic (IMAGE object, LINE\_SAMPLES)  
 $x = (nl/2 - j) * MAP\_SCALE$   
 $y = (i - ns/2) * MAP\_SCALE$

The view ray emanates from  $(x, y, 0)$  and points straight down  $(0,0,1)$ . If the ray misses the surface in step E of Section 5.3.13.3 above, it is changed to point straight up  $(0,0,-1)$ .

Figure 5.2.1.13.8 shows a vertical view. It assumes that the field is a plane tangent to the Martian surface with up pointing north. This is not an Orthorectified rendering but is still useful in many situations.

**Figure 5.2.1.13.8 - Vertical Projection Mosaic**

### 5.2.1.13.9 “Orthographic Projection Mosaic” RDR

The Orthographic projection is a generalization of the Vertical projection intended primarily for use with MAHLI data. It differs from Vertical in that an arbitrary projection plane can be specified.

If O is the point specified by the PROJECTION\_ORIGIN\_VECTOR and Xhat and Yhat are the unit vectors given by PROJECTION\_X\_AXIS\_VECTOR and PROJECTION\_Y\_AXIS\_VECTOR respectively, then an arbitrary point P will have projection coordinates (X,Y) as follows:

$$\vec{X} = (\vec{P} - \vec{O}) \cdot \hat{\vec{X}}$$

$$\vec{Y} = (\vec{P} - \vec{O}) \cdot \hat{\vec{Y}}$$

where the “•” indicates the scalar dot product of two vectors. PROJECTION\_Z\_AXIS\_VECTOR is the direction of projection; the three vectors form a right-handed orthonormal basis.

All of these quantities must be specified with respect to a single frame defined by the REFERENCE\_COORD\_SYSTEM\_NAME and REFERENCE\_COORD\_SYSTEM\_INDEX. Additional relevant parameters for the projection are MAP\_SCALE, X\_AXIS\_MINIMUM, X\_AXIS\_MAXIMUM, Y\_AXIS\_MINIMUM, and Y\_AXIS\_MAXIMUM.

A Vertical projection is the same as Orthographic with PROJECTION\_X\_AXIS\_VECTOR = (1,0,0), PROJECTION\_Y\_AXIS\_VECTOR = (0,1,0), and PROJECTION\_Z\_AXIS\_VECTOR = (0,0,1).

### 5.2.1.13.10 “Orthorectified Projection Mosaic” RDR

Orthorectified mosaics are used to show a “true” view of the scene from a different point of view, without distortion due to parallax. The point of view is usually overhead, resulting in an image suitable for comparison to satellite imagery. The removal of parallax necessarily leads to holes or gaps in the mosaic, which do not occur with the other projections.

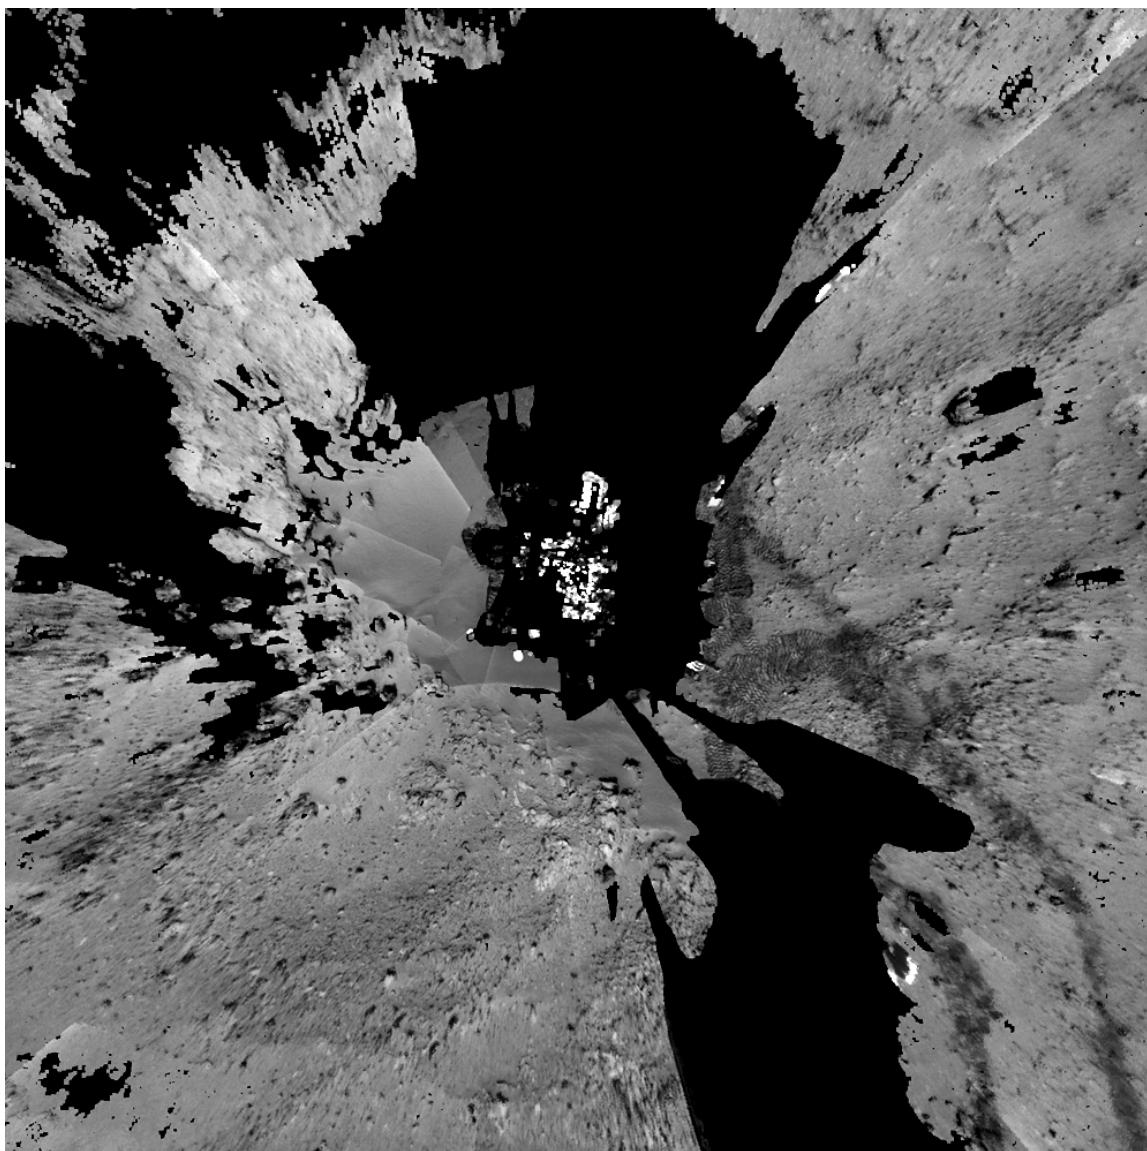

The Orthorectified mosaic is projected to a plane in a similar manner to the Orthographic or Vertical projections. However, unlike any of the other projections, the XYZ location of the pixels are taken into account. This is what allows parallax to be removed.

A simple way to think of this, for the case of an Orthorectified-Vertical projection, is to attach the XYZ coordinate (derived from stereo analysis) to each input image pixel, chop off the Z coordinate, and use the XY coordinates as the position in the output image. The more general (non-Vertical) case is similar in concept, just rotate the XYZ values to the frame defined by the projection plane first.

The most common projection plane is to look straight down, which corresponds to the same point of view as the Vertical projection. For this case, PROJECTION\_X\_AXIS\_VECTOR = (1,0,0), PROJECTION\_Y\_AXIS\_VECTOR = (0,1,0), and PROJECTION\_Z\_AXIS\_VECTOR = (0,0,1).

The specific algorithm must deal with filling holes in the output mosaic and is still to be determined, as the software for this projection remains under development as of this writing.

Figure 5.2.1.13.10 shows an orthorectified rendering.

**Figure 5.2.1.13.10 - Orthorectified Projection Mosaic**

#### **5.2.1.13.11 Non-image Mosaics**

Normally mosaics are created using imagery, where each pixel is either a raw or radiometrically corrected intensity value. However, mosaics can also be created using other types of pixels. In fact, any of the RDR types using an image format (e.g. not meshes) can be mosaicked. The most useful of these are mosaics of XYZ, surface normal, and the various Slope types.

For example, an XYZ mosaic contains XYZ values for each pixel in the mosaic rather than intensity values. The inputs to the mosaic program are XYZ files (or individual X, Y, or Z components), and the pixels are interpreted in the same way - as the coordinate of the corresponding pixel in Cartesian

space. Like XYZ images, the mosaics may consist of a single 3-band file with X, Y, and Z components, or separate 1 band files for each component. A Z-only mosaic of a Vertical or Orthorectified-Vertical projection creates a digital elevation model (DEM) - approximate in the Vertical case, correct for Orthorectified-Vertical.

As another example, Slope mosaics are often created and then overlaid on an image mosaic using the same projection parameters to help with rover navigation.

For MSL, a common product is the "Chemcam Finder" mosaic. This consists of a set of three Polar projection mosaics: the imagery, the range, and the rover exclusion mask. The mask is adjusted based on actual or predicted arm locations. The overlay of the mask mosaic over the image aids the Chemcam team in targeting (to avoid the rover and the arm), while the overlay of range helps determine focus distances for commanding.

Care must be taken while producing these mosaics to ensure that a consistent coordinate system and data type are used for all the input images. No transform is done on the data; the output mosaic may have only one coordinate system in which the values are defined, and one DERIVED\_IMAGE\_TYPE.

Non-image mosaics are often created without interpolation; the nearest pixel is used instead. This avoids aliasing effects when pixels are interpolated with neighboring invalid pixels.

#### **5.2.1.14 “Anaglyph” RDR**

A stereo anaglyph is a method of displaying stereo imagery quickly and conveniently using conventional display technology (no special hardware) and red/blue glasses. This is done by displaying the left eye of the stereo pair in the red channel, and displaying the right eye in the green and blue channels. An anaglyph data product simply captures that into a single 3-band color image, which can be displayed using any standard image display program with no knowledge that it is a stereo image. The red (first) band contains the left eye image, while the green and blue (second and third) bands each contain the right eye image (so the right image is duplicated in the file).

The Anaglyph method can also apply to multi-frame mosaic products. MIPL-generated mosaic Anaglyphs occasionally required some subtle pixel-shifting of the right eye mosaic data to improve the stereo effects. Mosaic Anaglyph products are distinguishable in the Mosaic RDR filename convention (see Section 6.1.2).

### **5.2.2 Spectroscopy RDRs**

ChemCam EDR LIBS spectra will be used to generate three standard RDR products.

#### **5.2.2.1 “Initial LIBS Spectrum” RDR**

This product will contain the spectrum data for each spectrum available in the EDR file, the processed median of the spectrum data and the processed average of all spectra. In a later release the Standard Deviation, 1<sup>st</sup> and 3<sup>rd</sup> quartile will be added. Processing includes the following steps: (1) dark subtraction, (2) correction for drift, (3) denoising, (4) continuum removal, (5) calibration in wavelength and (6) resampling. The identifier in the filename for this product is “RDR”.

The format of this RDR is described in Table 5.2.2.1:

**Table 5.2.2.1 - LIBS RDR**  
(total rows: 6144 + comments)

Column Number	Name	Data Type	Description
1	Wavelength	Double	Calibrated wavelength
2 ... N+1 (where N is number of spectra received)	Spectra Digital Number (DN)	Double	Intensity in DN for each spectrum
N+2	Median Spectrum Digital Number (DN)	Double	Intensity in DN of Median of all shots
N+3	Average Spectrum Digital Number (DN)	Double	Intensity in DN of Average of all shots

The data will be preceded by several rows of comments, and key parameters used in the data processing.

### 5.2.2.2 “Intermediate Clean Calibrated Spectra” RDR

This product will contain the spectrum for each shot available in the EDR file and an averaged spectrum that have been: (1) dark subtracted, (2) corrected for drift, (3) denoised, (4) continuum removed, (5) calibrated in wavelength, (6) resampled and (7) corrected for instrument response. The identifier in the filename for this product is “CCS”.

The format of this RDR is described in Table 5.2.2.2, where term “radiance” equates to “photon/shot/mm<sup>2</sup>/sr/nm”:

**Table 5.2.2.2 – Clean Calibrated Spectra**  
(total rows: 6144 + comments)

Column Number	Name	Data Type	Description
1	Wavelength	Double	Calibrated wavelength
2 ... N+1 (where N is number of spectra received)	Spectra Radiance	Double	Intensity in radiance for each spectrum processed
N+2	Median Spectrum Radiance	Double	Intensity in radiance of Median of all spectra processed
N+3	Average Spectrum Radiance	Double	Intensity in radiance of Average of all spectra processed

The data will be preceded by several rows of comments, and key parameters used in the data processing.

### 5.2.2.3 “Multivariate Prediction of Oxide Composition” RDR

Through a partial least-square model based on laboratory spectra of geostandard reference samples, derive the target composition in oxide weight percent, including uncertainties. The analysis may produce results for individual shots or an average of the individual shots (excluding the first five shots which typically represent dust). The identifier in the filename for this product is “MOC”.

The format of this RDR is described in Table 5.2.2.3:

**Table 5.2.2.3 - Elemental Composition Predictions (Oxide Weight)**

Row Number	Name	Data Type	Description
1	Oxides	Text	Oxides and elements are labeled across the top of each section
2	RMSEP	Double	Root mean square error prediction equivalent to an absolute error estimation given in the units for that element, i.e., oxide are in wt% and trace elements are in parts per million (ppm) weight
3	Predicted Elemental Abundances	Double	Predicted oxide abundance for the average spectrum in the units of that element, i.e., oxide are in wt% and trace elements are in parts per million (ppm) weight

Preceding the data will be several rows of comments. The number of oxides may vary in future data releases, but the major elements that are reported are: **SiO<sub>2</sub>, TiO<sub>2</sub>, Al<sub>2</sub>O<sub>3</sub>, Fe<sub>2</sub>O<sub>3</sub>T, MgO, CaO, Na<sub>2</sub>O, K<sub>2</sub>O**.

## 5.3 RDR Product Format

### 5.3.1 Image RDRs

The image RDR data products covered by this SIS are listed in Tables 5.3.1.1 and 5.3.1.2 below. Products listed as “1-3” bands are generally 1-band products but could have 3 RGB bands for certain MMM camera modes.

**Table 5.3.1.1 - MSL Camera Image RDR Binary Formats**

Description	Product Identifier	# Bands	Data Type	DERIVED_IMAGE_TYPE Keyword value
CAHV-linearized	LIN	1-3	16-bit signed integer or 8-bit unsigned byte	“IMAGE”
Bayer pattern	BAY	1-3	16-bit signed integer	“IMAGE”
Inverse lookup table (ILUT)	ILT	1-3	16-bit signed integer	“IMAGE”
	ILC	1-3	16-bit signed integer	“IMAGE”
	ILP	1-3	16-bit signed integer	“IMAGE”
Radiometrically corrected	RAD	1-3	16-bit signed integer	“IMAGE”
	RAS	1-3	16-bit signed integer	“IMAGE”
	RAF	1-3	Float	“IMAGE”
Radiometrically corrected for Instrument Effects	RIE	1-3	16-bit signed integer	“IMAGE”
	RIF	1-3	Float	“IMAGE”
Radiometrically corrected IOF radiance factor	IOI	1-3	16-bit signed integer	“IMAGE”
	IOF	1-3	16-bit signed integer	“IMAGE”

Table 5.3.1.2 - MSL Camera Non-image RDR Binary Formats

Description	Product ID	# Bands	Data Type	Data Structure
Terrain Mesh	Terrain Mesh RDR	N/A	Inventor (IV)	IV
JPEG compressed	JPEG compressed	3	8-bit unsigned	JPEG, no label

### 5.3.2 Spectroscopy RDRs

Each ChemCam LIBS RDR data file is a comma delimited ASCII text table. Each line or record in the files is terminated with a two-character sequence of carriage return (<CR>, ASCII 13) and line feed (<LF>, ASCII 10) to comply with PDS standards. This line terminator sequence will allow the data files and labels to be easily read on most computers, which recognize either the carriage return, the line feed, or the <CR>/<LF> sequence as an ASCII record terminator.

**Table 5.3.2 - MSL LIBS Spectroscopy RDR Binary Formats**

Name	Product Identifier	Data Type	Standard / Special
LIBS Spectrum	RDR	Double	Standard
Intermediate Clean Calibrated Spectra	CCS	Double	Special
Multivariate Prediction of Oxide Composition	MOC	Double, ASCII	Standard

## 5.4 RDR Product Structure

RDR products will have three possible structures. RDRs generated by MIPL will have a VICAR label wrapped by an ODL label, see Figure 5.4, Diagram A). This is the same as the EDR format, with the exception that the binary header data are eliminated. RDR products not generated by MIPL may look the same, or they may omit the VICAR label, containing only an ODL label (Figure 5.4, Diagram B). Or, RDR products conforming to a standard other than PDS, such as JPEG compressed or certain Terrain products (Figure 5.4, Diagram C), may contain no additional labels, instead following the other standard's formatting. In any case, RDRs will also have a detached PDS label. For a description of the PDS and ODL labels, see Section 3.2.1, and for a description of the VICAR Label, see Section 3.2.2, and for a mapping between PDS/ODL and VICAR, see Section 3.2.3.

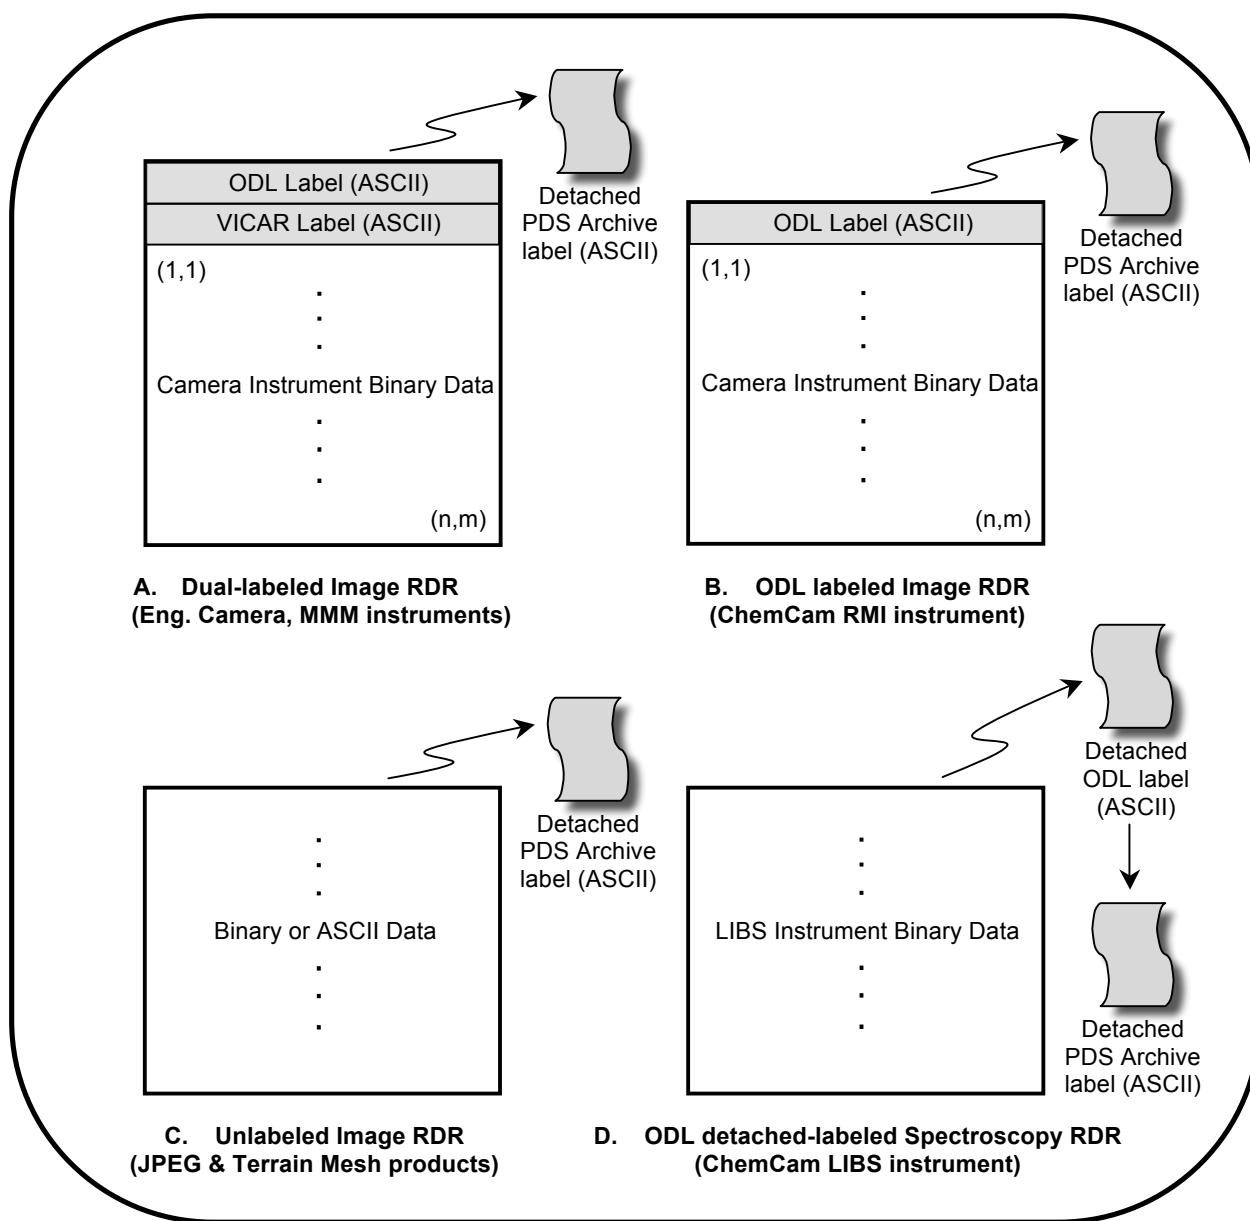

Figure 5.4 - RDR Product Structures

The RDR data product is comprised of processed versions of the raw camera data, in both single and multi-frame (mosaic or mesh) form. Most RDR data products will be in “image” format, having detached PDS labels, as well as attached ODL labels or, if generated by MIPL (OPGS), dual attached ODL/VICAR labels. Non-labeled RDRs include JPEG compressed products and the Terrain products.

For Mosaic RDRs, the detached PDS label is shared amongst four types of archiveable files: a) the “.IMG” Mosaic image file, b) the “.NAV” navigation file, c), the “.BRT” brightness correction file, and d) the “.LIS” list file indentifying the mosaic component images. For a description of “b” and “c”, see Section 5.2.1.13.3. To support the four types of Mosaic files, the PDS label contains four FILE Objects in the structure. See Appendix B for an example of a Mosaic RDR detached PDS label.

## 6. STANDARDS USED IN GENERATING PRODUCTS

### 6.1 File Naming Standards

The file naming schemes adhere to the Level II 36.3 filename standard approved by PDS in 2009. This is a change from the 27.3 convention that MER and PHX were constrained to using. Use of three-character extensions, such as “.IMG” for image EDRs and RDRs and “.DAT” for spectrum EDRs and state-of-health EDRs, is consistent with the PDS standard.

There are three file naming schemes adapted for the MSL image and non-image data products. The first applies to the EDR data product and all Single-frame RDR data products. The second applies to all Mosaic RDR data products. The third applies to Terrain products.

The primary attributes of the filename nomenclature are:

- a) Uniqueness - It must be unique unto itself without the file system’s directory path. This Protects against product overwrite as files are copied/moved within the file system and external to the file system, if managed correctly.
- b) Metadata - It should be comprised of metadata fields that keep file bookkeeping and sorting intuitive to the human user. Even though autonomous file processing will be managed via databases, there will always be human-in-the-loop that puts a premium on filename intuition. Secondly, the metadata fields should be smartly selected based on their value to ground processing tools, as it is less CPU-intensive to extract information from the filename than from the label.

NOTE: Metadata information in the filename also resides in the product label.

The metadata fields have been selected based on MER and PHX lessons learned. In general, the metadata fields are arranged to achieve:

- a) Sortability - At the beginning of the filename resides a primary time oriented field such as Spacecraft Clock Start Count (SCLK). This allows for sorting of files on the MSL file system by spacecraft data acquisition time as events occurred on Mars.
- b) Readability - An effort is made to alternate Integer fields with ASCII character fields to Optimize differentiation of field boundaries for the human user.

#### 6.1.1 EDR and Single-frame RDR Filename

Each MSL EDR and Single-frame RDR data product can be uniquely identified by incorporating into the product filename at minimum the Instrument ID, SCLK, Product Type identifier, Site, Drive and Command Sequence identifier. The convention is illustrated in Figure 6.1.1 below.

The Single-frame RDR data products that share the naming scheme with the EDR data product are numerous. They are listed in the description of the Product Type field found in the filename convention definition, which follows:

<b>inst</b> (2 char)	<b>config</b> (1 alphanumeric)	<b>spec</b> (1 char)	<b>sclk</b> (9 alphanumeric)	<b>prodid</b> (3 char)	<b>geom</b> (1 char)	<b>samp</b> (1 char)	<b>site / video</b>	<b>drive / video</b>	(3 alphanumeric)	<b>seqid</b> (4 alphanumeric)	<b>venue / who</b>	<b>ver</b> (1 alphanumeric)	<b>ext</b> (1 alphanumeric)	.
1 - 2	3	4	5 - 13	14 - 16	17	18	19 - 21	22 - 25	26 - 34	35	36	37	38 - 40	

**Figure 6.1.1 – EDR and Single-frame RDR Filename Convention**

where,

**inst** = (2 alpha character) Instrument ID, denoting the source MSL science or engineering instrument that acquired the data.

Valid values for Instrument IDs are:

“FL” - Front Hazcam Left	“MR” - MastCam Right
“FR” - Front Hazcam Right	“MS” - MastCam Stereo (2-banded)
“FS” - Front Hazcam Stereo (2-banded)	“MA” - MastCam Anaglyph (3-banded)
“FA” - Front Hazcam Anaglyph (3-banded)	“MG” - Mastcam Colorglyph (Lr, Rg, Rb)
“RL” - Rear Hazcam Left	“MH” - MAHLI
“RR” - Rear Hazcam Right	“HL” - MAHLI used as Stereo Left
“RS” - Rear Hazcam Stereo (2-banded)	“HR” - MAHLI used as Stereo Right
“RA” - Front Hazcam Anaglyph (3-banded)	“HS” - MAHLI Stereo (2-banded)
“NL” - Navcam Left	“HA” - MAHLI Anaglyph (3-banded)
“NR” - Navcam Right	“HG” - MAHLI Colorglyph (Lr, Rg, Rb)
“NS” - Navcam Stereo (2-banded)	“MD” - MARDI
“NA” - Navcam Anaglyph (3-banded)	“CR” - ChemCam RMI
“ML” - MastCam Left	“CL” - ChemCam LIBS
	“CC” - ChemCam generic

Valid values for Instrument IDs not described in this SIS:

“AP” - APXS	“RM” - REMS
“CM” - CheMin	“SM” - SAM
“DN” - DAN	“SP” - SA/SPaH
“RD” - RAD	

**config** = (1 alphanumeric) Instrument Configuration, an operational attribute of the Instrument that assists in characterizing the data.

Valid values for MSL camera instruments:

Instrument	Configuration	
	Values	Description
Front Hazcam Left (“FL”)	“A”, “B”	A-side configuration, B-side configuration
Front Hazcam Right (“FR”)	“A”, “B”	A-side configuration, B-side configuration

Front Hazcam Stereo (“FS”)	“A”, “B”	A-side configuration, B-side configuration
Front Hazcam Anaglyph (“FA”)	“A”, “B”	A-side configuration, B-side configuration
Rear Hazcam Left (“RL”)	“A”, “B”	A-side configuration, B-side configuration
Rear Hazcam Right (“RR”)	“A”, “B”	A-side configuration, B-side configuration
Rear Hazcam Stereo (“RS”)	“A”, “B”	A-side configuration, B-side configuration
Rear Hazcam Anaglyph (“RA”)	“A”, “B”	A-side configuration, B-side configuration
Navcam Left (“NL”)	“A”, “B”	A-side configuration, B-side configuration
Navcam Right (“NR”)	“A”, “B”	A-side configuration, B-side configuration
Navcam Stereo (“NS”)	“A”, “B”	A-side configuration, B-side configuration
Navcam Anaglyph (“NA”)	“A”, “B”	A-side configuration, B-side configuration
ChemCam RMI (“CR”)	“0”	For ChemCam images, the types are: 0 = Image data (Fullframe, Subframe, Downsampled, Thumbnail, Reference Pixel, Row-summed, Column-summed, Histogram)
ChemCam LIBS (“CL”)	“0” - “9”	For ChemCam spectra, the types are: 0 = 1-D Average Spectra, no laser 1 = 1-D Single Spectra, no laser 2 = Spectra Stats (Mean & Std Dev), no laser 3 = 2-D Diagnostic, no laser 4 = 1-D Average Spectra Laser 5 = 1-D Single Spectra Laser 6 = Spectra Stats (Mean & Std Dev), laser capable 7 = 2-D Diagnostic Laser 8 = Spectra Stats (all), laser capable 9 = Spectra Stats (all), no laser
ChemCam generic (“CC”)	“0” - “5”	For ChemCam Generic, the types are: 0 = SOH 1 = Params 2 = Memory Dump 3 = Debug Dump 4 = Move Focus 5 = Util Test
MastCam Left (“ML”)	“0” - “7”	For all EDRs and those RDRs that are NOT “Bayer-pattern” or “color-split”: Filters 0 thru 7
	“R”, “G”, “B”, “F”, “U”, “L”, “D”, “C”, “A”	R = <b>Red</b> Bayer cells only, or Red band of JPEG’d product G = <b>Green</b> Bayer cells only, or Green band of JPEG’d product B = <b>Blue</b> Bayer cells only, or Blue band of JPEG’d product F = <b>Full</b> color de-Bayered RGB merged into single 3-band image U = <b>Upper</b> half of Green cells only L = <b>Lower</b> half of Green cells only D = All Green cells ( <b>double</b> resolution in one dimension) C = All cells, <b>corrected</b> for responsivity

		with the filter A = All cells, with 2x2 averaging
MastCam Right ("MR")	"0" - "7"	For all EDRs and those RDRs that are NOT "Bayer-pattern" or "color-split": Filters 0 thru 7
	"R", "G", "B", "F", "U", "L", "D", "C", "A"	For "Bayer-pattern" or "color-split" RDRs: (same as for MastCam Left)
MastCam Stereo ("MS")	"0" - "7"	For all EDRs and those RDRs that are NOT "Bayer-pattern" or "color-split": Filters 0 thru 7
	"R", "G", "B", "F", "U", "L", "D", "C", "A"	For "Bayer-pattern" or "color-split" RDRs: (same as for MastCam Left)
MastCam Anaglyph ("MA")	"0" - "7"	For all EDRs and those RDRs that are NOT "Bayer-pattern" or "color-split": Filters 0 thru 7
	"R", "G", "B", "F", "U", "L", "D", "C", "A"	For "Bayer-pattern" or "color-split" RDRs: (same as for MastCam Left)
MAHLI ("MH")	"0" - "3"	For all EDRs and those RDRs that are NOT "Bayer-pattern" or "color-split": 0 = cover closed, LEDs off 1 = cover open, LEDs off 2 = cover closed, LEDs on 3 = cover open, LEDs on
	"R", "G", "B", "F", "U", "L", "D", "C", "A"	For "Bayer-pattern" or "color-split" RDRs: (same as for MastCam Left)
MARDI ("MD")	"0"	For all EDRs and those RDRs that are NOT "Bayer-pattern" or "color-split": 0 = no Filters
	"R", "G", "B", "F", "U", "L", "D", "C", "A"	For "Bayer-pattern" or "color-split" RDRs: (same as for MastCam Left)

**spec** = (1 character) Special Processing flag, applicable to RDRs only.

The Special Processing character is used to indicate off-nominal or special processing of the image. Examples include a) use of different correlation parameters, b) special stretches to eliminate shadows, c) reprocessing with different camera pointing, etc.

The meaning of any individual character in this field will be defined on an ad-hoc basis as needed during the mission. Within one Sol or a range of Sol's, the character will be used consistently. So, this field can be used to group together all derived products resulting in one kind of special processing. An attempt will be made to maintain consistency across different Sol's as well, but this may not always be possible; thus the meaning of characters may change across different individual or ranges of Sol's, depending on the definition.

A ".txt" ASCII text file will be maintained containing all special processing designators that are used, the Sol's they relate to, and a description of the special processing that was done. This file will be included in the PDS archive.

This field has the following rule-of-thumb:

Best Tactical - If value is character "T", it indicates "best tactical" if other than nominal

processing. The intent of this is to hold a copy of the special product best suited for tactical planning (at the discretion of OPGS ops personnel in consultation with tactical planners). Such products should have an ordinary special processing flag documented as described here, but be copied to flag "T" (incrementing version if necessary) if they are to be used for tactical planning.

If there is no "T", then the nominal "\_" should be used for tactical planning.

Valid values are:

Special Processing	EDR Value	RDR Value
none	"_" —	"_" —
Special method types A-S and U-Z	n/a	"A" - "S", "U" - "Z"
Best tactical Special method	n/a	"T"

**sclk** = (9 alphanumeric) Spacecraft Clock Start Count, in units of seconds.

Which specific SCLK is used depends on the instrument but is generally expected to be the time the data was acquired. For the engineering cameras and ChemCam, the SCLK in the IDPH is used. For MMM cameras, the SCLK in the MMM mini-header is used. It is not guaranteed that this SCLK match the DVT (Data Validity Time) used for operational data management.

The valid SCLK values, in their progression, are as follows (non-Hex):

Range 000000000 thru 999999999 - "000000000", "000000001", ... "999999999"

Range 1000000000 thru 1099999999 - "A000000000", "A00000001", ... "A99999999"

Range 1100000000 thru 1199999999 - "B000000000", "B00000001", ... "B99999999"

•

•

•

Range 3500000000 thru 3599999999 - "Z00000000", "Z00000001", ... "Z99999999"

**prodid** = (3 characters) Product Type identifier.

This field has the following rule-of-thumb:

Beginning "E" or "N" - Type of EDR, which is the first order product with no processing applied, such as geometric correction ("linearization") or radiometric correction. A beginning "N" denotes the EDR as a type of NavMap product (see Section 4.2.4.2). If no beginning "E" or "N", then the product is an RDR.

The various image EDR and RDR Product Type values, which are many and can be somewhat confusing, are color-coded for easier interpretation according to the following themes:

a) Primary to End-user: most important, most used, most popular products

b) Secondary: intermediate product, or final product not commonly used

c) Special: generated outside of Pipeline as special request and not nominal

Valid values for Product identifiers are listed below for EDRs:

EDR Product Type Description	Value
First order product	"EDR"
Reference Pixel	"ERP"
Row-summed	"ERS"
Column-summed	"ECS"
Histogram	"EHG"
IDPH-only	"EID"
State-of-Health Initialize (ChemCam SOH only)	"EIN"
State-of-Health Power On (ChemCam SOH only)	"EPW"
State-of-Health Power Off (ChemCam SOH only)	"EPO"
State-of-Health Warmup (ChemCam SOH only)	"EWU"
State-of-Health Sun Safe (ChemCam SOH only)	"ESS"
Original JPEG as received from rover (MMM cameras only)	"EJP"
Z-stack combined image (MMM cameras only)	"EZS"
Depth map image (MMM cameras only)	"EDM"
Video image (MMM cameras only)	"EVD"
Recovered EDR (MMM cameras only)	"ERD"
Nav Map Goodness	"NGD"

Solar Energy with Overlay	“SEO”
Incidence, Emission, Phase angles	“IEP”
Incidence, Emission, Phase angles Filled	“IEF”

Valid values for Product identifiers are listed below for Spectroscopy (LIBS) RDRs:

Spectroscopy (LIBS) RDR Product Type Description	Value
Initial LIBS Spectrum	“RDR”
Multivariate Prediction of Oxide Composition	“MOC”
Intermediate Clean Calibrated Spectra	“CCS”

**geom** = (1 alphanumeric) Geometry type, used to differentiate products as having camera-induced distortion removed (“linearized”) or not removed (“non-linearized”). For MMM camera products, also serves a secondary function by flagging changes in compression mode across iterations of the same data to distinguish between MMM product types.

Products from stereo cameras are normally linearized using the nominal stereo partner (whether the partner image was actually acquired or not). Products such as long-baseline or re-pointed stereo pairs, however, are often linearized using the actual stereo partner, resulting in different geometry.

This field has the following rules-of-thumb:

- a) Linearization - If value is any alpha character “A - Z”, then product is “linearized” using one of the two modes (nominal or actual) according to the table below. If value is not any alpha character, then product is “non-linearized”.
- b) First Compression Mode - For all cameras, if value is an underscore (“\_”), “L” (for “linearized-nominal”) or “A” (for “linearized-actual”), it denotes that compression mode is for the first instance of the product data processed on the ground. The identity of the mode type, whether “uncompressed” or a type of compression, is not provided here.
- c) Changed Compression Modes - For MMM cameras, if value is an integer “1 - 9, 0” (iterating numerically in order of 1, 2 ... 9, 0), or in the character ranges “M - V” (iterating alphabetically after “L” for “linearized-nominal”) or “B - K” (iterating alphabetically after “A” for “linearized-actual”), it indicates a different compression

mode than all previous modes noted. Again, the identity of the mode type, whether “uncompressed” or a type of compression, is not provided here.

These flags are necessary because operation of MMM cameras includes the possibility that the same image be requested multiple times from the rover, each with different compression modes. In these cases, the compression mode for the first product processed on the ground is noted. Thereafter, if the compression mode for any subsequent product processed on the ground is different than all previous modes, it will be noted and indexed incrementally (using alpha characters for “linearized” and integers for “non-linearized”).

**NOTE:** Retransmissions or reprocessing of the same compression mode will reuse the appropriate mode character, with filename’s Version field incrementing for each retransmission.

See the following table of valid values:

Camera Types	All	1 <sup>st</sup> compression mode received	Linearized	
			Nominal	Actual
MMM only		2 <sup>nd</sup> compression mode, different than any previous mode	“1”	“M”
		3 <sup>rd</sup> compression mode, different than any previous mode	“2”	“N”
		•	•	•
		•	•	•
		10 <sup>th</sup> compression mode, different than any previous mode	“9”	“U”
		11 <sup>th</sup> compression mode or higher, different than any previous mode	“0”	“V”

**NOTE:** The EDR controls the compression mode flag. All RDRs derived from a given EDR share the same row in the table above. So, “2” and “N” and “C” will always correspond, for example.

**samp** = (1 character) Sample type, indicating how the data was sampled.

Valid values for Sample type are:

- “F” - Full frame raster data, full resolution
- “S” - Subframed raster data, full resolution
- “D” - Downsampled raster data, reduced resolution
- “M” - Mixed (Subframe and Downsampled) raster data, mixed resolution
- “T” - Thumbnail raster data, reduced resolution
- “B” - Bayer extraction subsampling (MMM only) raster data
- “Y” - Thumbnail Bayer extraction subsampling (MMM only) raster data
- “N” - Non-raster data

**site** = (3 alphanumeric) Site location count, from the RMC.  
**/video**

This field has the following rules-of-thumb:

- a) Site - If value is any 3 alphanumeric characters, or 3 underscores (denoting value is out-of-range), then content represents Site index extracted from RMC.

b) Video Subframe / Recovered Data - If first character is underscore ("\_") followed by integers in remaining positions, then value occupies Site and Drive fields and represents MMM data in either of two scenarios: "Video Subframe" or "Recovered Data". In total, this consists of a leading underscore followed by 5 integers followed by a trailing underscore (example: "\_00000\_"). The 5 integers are 5 bytes in HEX representation. They are used to disambiguate multiple frames occurring in the same second. The meaning of the values slightly differ according to the scenario:

- Video Subframe - The 4 leftmost of these are the lowest 4 bytes of the Product ID entity in the MMM mini-header. The 5<sup>th</sup> rightmost integer is the Frame Number entity in the MMM mini-header, indicating which frame the image is (out of a possible 16 that can be packed into a single video data product).
- Recovered Data - The 5 Hex values denote the Image ID to uniquely identify products that share the same SCLKs.

The valid Site values, in their progression, are as follows (non-Hex):

Range 000 thru 999 - "000", "001", ... "999"

Range 1000 thru 1099 - "A00", "A01", ... "A99"

Range 1100 thru 1199 - "B00", "B01", ... "B99"

•

•

•

Range 3500 thru 3599 - "Z00", "Z01", ... "Z99"

Range 3600 thru 3609 - "AA0", "AA1", ... "AA9"

Range 3610 thru 3619 - "AB0", "AB1", ... "AB9"

•

•

•

Range 3850 thru 3859 - "AZ0", "AZ1", ... "AZ9"

Range 3860 thru 3869 - "BA0", "BA1", ... "BA9"

Range 3870 thru 3879 - "BB0", "BB1", ... "BB9"

•

•

•

Range 10350 thru 10359 - "ZZ0", "ZZ1", ... "ZZ9"

Range 10360 thru 10385 - "AAA", "AAB", ... "AAZ"

Range 10386 thru 10411 - "ABA", "ABB", ... "ABZ"

•

•

•

Range 27910 thru 27935 - "ZZA", "ZZB", ... "ZZZ"

Range 27936 thru 27961 - "0AA", "0AB", ... "0AZ"

Range 27962 thru 27987 - "0BA", "0BB", ... "0BZ"

•

•

•

Range 32720 thru 32745 - "7CA", "7CB", ... "7CZ"

Range 32746 thru 32767 - "7DA", "7DB", ... "7DV"

Value is out of range - "\_\_\_" (3 consecutive underscores)

**drive** = (4 alphanumeric) Drive (position-within-Site) location count, from the RMC.  
**/video** This field has the following rules-of-thumb:

- a) Drive - If value is any 4 alphanumeric characters, or 4 underscores (denoting value is out-of-range), then content represents Drive index extracted from RMC.

- b) Video Subframe / Recovered Data - If last character is underscore (“\_”) preceded by integers in remaining positions, then value occupies Site and Drive fields and represents MMM data in either of two scenarios: “Video Subframe” or “Recovered Data”. See “b” in Site field description above for more details.

The valid Drive values, in their progression, are as follows (non-Hex):

Range 0000 thru 9999 - “0000”, “0001”, ... “9999”

Range 10000 thru 10999 - “A000”, “A001”, ... “A999”

•  
•  
•

Range 35000 thru 35999 - “Z000”, “Z001”, ... “Z999”

Range 36000 thru 36099 - “AA00”, “AA01”, ... “AA99”

•  
•  
•

Range 38500 thru 38599 - “AZ00”, “AZ01”, ... “AZ99”

Range 38600 thru 38699 - “BA00”, “BA01”, ... “BA99”

•  
•  
•

Range 65500 thru 65535 - “LJ00”, “LJ01”, ... “LJ35”

Value is out of range - “\_\_\_\_\_” (4 consecutive underscores)

**seqid** = (9 alphanumeric) Sequence identifier. Composed of a 4-char subfield and a 5-digit numeric subfield representing the 6-bit “Category” and 14-bit numeric components of the commanded Sequence ID, respectively.

**venue** = (1 character) Venue and Product Producer ID shared in the same field.

**/who** Venue denotes Flight Model versus Engineering Model in data acquisition. Product Producer ID identifies the institution that generated the product.

This field has the following rules-of-thumb:

- a) Venue - A value in the range “A - P” indicates Flight Model rover. A value in the range “Q - Z” indicates Engineering (testbed) rover. The range “N - O” is not used.
- b) Producer - If value is “P” (for Flight) or “Y” (for Engineering), the provider of the product is the Principal Investigator. Except for MIPL as the provider (“M” for Flight or “Z” for Engineering), the remaining characters are assigned to Co-investigator providers at the discretion of the P.I. and will be identified in due time. Within the instrument of the P.I., characters are unique. Across instruments, characters are reusable.

See the following table of valid values:

Venue		by Producer								
Flight Model	Eng. Model									
“M”	“Z”	MIPL (OPGS at JPL)								
“P”	“Y”	Principal Investigator of Instrument ... <table> <tr> <td>Instrument</td> <td>Principal Investigator</td> </tr> <tr> <td>MMM Cameras</td> <td>MSSS (San Diego, CA)</td> </tr> <tr> <td>ChemCam LIBS &amp; SOH</td> <td>LANL (Los Alamos, NM)</td> </tr> <tr> <td>ChemCam RMI</td> <td>IRAP (France)</td> </tr> </table>	Instrument	Principal Investigator	MMM Cameras	MSSS (San Diego, CA)	ChemCam LIBS & SOH	LANL (Los Alamos, NM)	ChemCam RMI	IRAP (France)
Instrument	Principal Investigator									
MMM Cameras	MSSS (San Diego, CA)									
ChemCam LIBS & SOH	LANL (Los Alamos, NM)									
ChemCam RMI	IRAP (France)									

<b>"A" - "L"</b>	<b>"Q" - "X"</b>	Co-Investigators (to be identified by P.I. per instrument)
------------------	------------------	--

See the following table of valid values for Instruments not covered by this SIS:

<b>Venue</b>		<b>by Producer</b>																
Flight Model	Eng. Model																	
<b>"M"</b>	<b>"Z"</b>	MIPL (OPGS at JPL)																
<b>"P"</b>	<b>"Y"</b>	Principal Investigator of Instrument ... <table style="margin-left: 20px;"> <tr><td>Instrument</td><td>Principal Investigator</td></tr> <tr><td>SAM</td><td>GSFC (Goddard, MD)</td></tr> <tr><td>REMS</td><td>Ministry of Education &amp; Science (Spain)</td></tr> <tr><td>DAN</td><td>Federal Space Agency (Russia)</td></tr> <tr><td>RAD</td><td>SwRI (Boulder, CO)</td></tr> <tr><td>CheMin</td><td>Ames Research Center (Mountain View, CA)</td></tr> <tr><td>APXS</td><td>Max-Planck Institute (Germany)</td></tr> <tr><td>SA/SPaH</td><td>JPL</td></tr> </table>	Instrument	Principal Investigator	SAM	GSFC (Goddard, MD)	REMS	Ministry of Education & Science (Spain)	DAN	Federal Space Agency (Russia)	RAD	SwRI (Boulder, CO)	CheMin	Ames Research Center (Mountain View, CA)	APXS	Max-Planck Institute (Germany)	SA/SPaH	JPL
Instrument	Principal Investigator

REMS	Ministry of Education & Science (Spain)																	
DAN	Federal Space Agency (Russia)																	
RAD	SwRI (Boulder, CO)																	
CheMin	Ames Research Center (Mountain View, CA)																	
APXS	Max-Planck Institute (Germany)																	
SA/SPaH	JPL																	
<b>"A" - "L"</b>	<b>"Q" - "X"</b>	Co-Investigators (to be identified by P.I. per instrument)																

**ver** = (1 alphanumeric) Version identifier. The Version number increments by one whenever an otherwise-identical filename would be produced.

The valid values, in their progression that excludes "0" altogether, are as follows (non-Hex):

Range 1 thru 9 - "1", "2", ... "9"

Range 10 thru 35 - "A", "B", ... "Z"

Range 36 and higher - "\_" (underscore)

Note that not every version need exist, e.g. versions 1, 2 and 4 may exist but not 3. In general, the highest-numbered Version represents the "best" version of that product.

NOTE: To be clear, this field increments independently of all fields, including the Special Processing field.

**ext** = (2 to 3 characters) Product type extension.

Valid values for nominal operations camera data products:

**"IMG"** - Image EDRs / RDRs (ODL label, may include embedded VICAR label)

**"VIC"** - Temporary image EDR / RDRs with only VICAR label (no ODL label)

**"iv"** - per-XYZ Terrain Mesh RDR in Inventor binary format (no label)

**"ht"** - per-XYZ Height Map RDR (VICAR label)

**"rgb"** - per-XYZ Terrain Mesh texture RDR in RGB format (no label)

**"LBL"** - Detached label file in PDS or ODL format

**"JPG"** - JPEG compressed (no label)

**"TIF"** - TIFF format (no label)

**"PNG"** - PNG format (no label)

**"TXT"** - Text file associated with Specially-processed files (no label)

**"tar"** - Tar file containing per-XYZ Terrain Mesh vertice tile files (no label)

Valid values for nominal operations non-camera data products:

**"QUB"** - Multi-layer spectral cube data

**"CSV"** - Comma-separated-value text file, used for LIBS RDRs

**"DAT"** - Non-imaging instrument data, including LIBS and ChemCam state-of-health

**"LBL"** - Detached label in PDS or ODL format

**"TAB"** - Table data

Of the above, only "IMG", "LBL", "JPG", "TXT", "QUB", "CSV", "DAT" and "TAB" are currently supported by PDS.

Example #1: NRA\_013760215EDR\_F0930008NCAM22103M1.IMG

where,

instr	=	<b>"NR"</b>	= Navcam Right
config	=	<b>"A"</b>	= "A-side" configuration

venue / who	=	<b>"P"</b>	= Flight Model data / produced by P.I. of MastCam (MSSS)

ver = "1" = Version 1  
 ext = "JPG" = JPEG product

### 6.1.2 Mosaic RDR Filename

The MSL camera Mosaic RDR data products are usually derived from multiple EDR or RDR data products mosaicked together, although they can also be derived from single data products. They are uniquely identified by incorporating into the product filename the Lander mission identifier, the "primary" Instrument identifier, the "secondary" Instrument identifier, the starting Sol denoting the start of mosaic data, the geometric Projection type, the Product Type ingested to build the mosaic, the starting Site location, the rover's starting Position within the site, the camera "Eye", the spectral Filter, the product Creator identifier and a Version number. The convention is illustrated in Figure 6.1.2 below.

The filename convention follows:

<i>inst1</i> (1 char)	<i>inst2</i> (1 char)	<i>eye</i> (1 char)	<i>filt</i> (3 alphanumeric)	<i>spec</i> (1 char)	<i>sol</i> (4 alphanumeric)	<i>multsol</i> (1 char)	<i>prodid</i> (3 char)	<i>site</i> (3 integer)	<i>proj</i> (3 char)	<i>geomcor</i> (1 char)	<i>frame</i> (1 char)	<i>britecor</i> (1 char)	<i>drive</i> (4 alphanumeric)	<i>multdrive</i> (1 char)	<i>mosid</i> (5 alphanumeric)	<i>who / venue</i> (1 char)	<i>ver</i> (1 alphanumeric)	<i>ext</i> (3 char)	
1	2	3	4 - 6	7	8 - 11	12	13 - 15	16 - 18	19 - 21	22	23	24	25 - 28	29	30 - 34	35	36	37	38 - 40

Figure 6.1.2 – Mosaic RDR Filename Convention

where,

*inst1* = (1 character) Instrument ID primary, denoting the source MSL science or engineering instrument that acquired the data. Valid values are:

- |                    |                   |
|--------------------|-------------------|
| "F" - Front Hazcam | "H" - MAHLI       |
| "R" - Rear Hazcam  | "D" - MARDI       |
| "N" - Navcam       | "C" - ChemCam RMI |
| "M" - Mastcam      |                   |

*inst2* = (1 character) Instrument ID secondary, denoting the source MSL science or engineering instrument that acquired the data. Valid values are:

- |                    |  |
|--------------------|--|
| "F" - Front Hazcam | "D" - MARDI                                  |
| "R" - Rear Hazcam  | "C" - ChemCam RMI                            |
| "N" - Navcam       | "X" - flag for more than 2 instruments       |
| "M" - Mastcam      | "_" - flag for no 2 <sup>nd</sup> instrument |
| "H" - MAHLI        |  |

*eye* = (1 character) Camera eye. Valid values are:

- |                                      |                               |
|--------------------------------------|-------------------------------|
| "L" - Left camera eye                | "A" - Anaglyph                |
| "R" - Right camera eye               | "G" - Colorglyph (Lr, Rg, Rb) |
| "M" - Monoscopic (non-stereo camera) | "N" - Not applicable          |

“**S**” - Stereo (2-band)                            “**X**” - Mixed  
 “**C**” - Color stereo (6-band)

**filt** = (3 alphanumeric) Spectral filter position. Valid values are:

“**0**” - Non-filter camera  
 “**0 - 8**” - Filter for MMM cameras  
 “**R**”, “**G**”, “**B**” - sRGB color space or de-Bayered results  
 “**X**”, “**Y**”, “**I**” - xyY color space  
 “**A**” - Alternative (define alternative color spaces if needed)

**spec** = (1 character) Special processing flag. See description and valid values for field “spec” in Section 6.1.1.

Valid values are:

Special Processing	Value
none	“ <b>_</b> ”
Special method types A-S and U-	“ <b>A</b> ” - “ <b>S</b> ”, “ <b>U</b> ” - “ <b>Z</b> ”
Best tactical Special method	“ <b>T</b> ”

**sol** = (4 alphanumeric) Primary Sol (for simulated or nominal surface ops) or Day of Year (DOY, for some testbed activities) included in mosaic. Nominally, it is the Sol or DOY of the last (in time order, the highest SCLK) input image built into the mosaic. This can change in off-nominal cases when special circumstances prevail.

The valid values, in their progression, are as follows (non-Hex):

Sol / DOY	Range	Values
Sol	0000 thru 9999	“ <b>0000</b> ”, “ <b>0001</b> ”, ... “ <b>9999</b> ”
	10000 thru 10999	“ <b>A000</b> ”, “ <b>A001</b> ”, ... “ <b>A999</b> ”
	11000 thru 11999	“ <b>B000</b> ”, “ <b>B001</b> ”, ... “ <b>B999</b> ”
		•
		•
		•
DOY	33000 thru 33999	“ <b>X000</b> ”, “ <b>X001</b> ”, ... “ <b>X999</b> ”
	Value is out of range	“ <b>_____</b> ” (4 consecutive underscores)
	001 thru 365 (2012)	“ <b>Y001</b> ”, “ <b>Y002</b> ”, ... “ <b>Y365</b> ”
	001 thru 365 (2013)	“ <b>Z001</b> ”, “ <b>Z002</b> ”, ... “ <b>Z365</b> ”
	Value is out of range	“ <b>_____</b> ” (4 consecutive underscores)

**multsol** = (1 character) Flag indicating that a “significant” percentage of the data content was acquired on more than a single Sol, ie., across multiple Sols. Specification of this flag is at the discretion of the Mosaic product’s provider, who determines what percentage is “significant”. Therefore, it is possible for a Mosaic product to contain data acquired across multiple Sols, but unless the provider determines that the portions are significant, this flag may not be activated.

Valid values are:

“**\_**” - Flags field Sol as solitary  
 “**X**” - Flags field Sol as one of multiple Sol

**prodid** = (3 characters) Input Product type identifier. See description and valid values for field "prodid" in Section 6.1.1.

**site** = (3 alphanumeric) Site location count, from the RMC. See description and valid values for field "site" in Section 6.1.1.

**proj** = (3 characters) Projection type. Valid values are:

"CYL"	- Cylindrical	"ORT"	- Orthographic
"PER"	- Perspective	"ORR"	- Orthorectified
"CYP"	- Cylindrical-Perspective	"VRT"	- Vertical (special case of Orthographic)
"POL"	- Polar		

**geomcor** = (1 character) Geometric correction type indicator. Specifies the correction type that was applied to the largest percentage of data content.

Valid values are:

" "	- No correction (raw pointing)	"T"	- Manual tiepointing
"A"	- Auto-correction via tiepointing	"R"	- Manual tiepointing & auto-registration with fiducials
"F"	- Auto-correction via tiepointing & auto-registration with fiducials	"M"	- Manual tiepointing & manual registration with fiducials
"G"	- Auto-correction via tiepointing & manual registration with fiducials	"O"	- Other correction not listed above

**frame** = (1 character) Coordinate system (frame) type. Valid values are:

"S"	- Site frame	"U"	- Untilt (CYP only, is Rover frame with rotation)
"L"	- Local Level frame	"O"	- Other
"R"	- Rover frame		

**britecor** = (1 character) Brightness correction type indicator. Specifies the correction type that was applied to the largest percentage of data content.

Valid values are:

" "	- No correction	"G"	- General brightness correction (manual)
"B"	- Automatic brightness adjustment (multiplicative and/or additive factor applied to each frame)	"A"	- General brightness correction that can vary across the frame (automatic)
"M"	- Manual brightness adjustment (same factors as "B")	"O"	- Other correction not listed above
"V"	- Anti-vignetting adjustment applied to some or all frames		

**drive** = (4 alphanumeric) Drive location count, from the RMC. See description and valid values for field "drive" in Section 6.1.1.

**multdrive** = (1 character) Flag indicating data content from multiple Drives (Positions). Valid values are:

" "	- Flags field Drive as solitary.
"X"	- Flags field Drive as <u>last</u> of multiple Drives.

**mosid** = (5 alphanumeric) General purpose mosaic identifier. Can be set to anything to help identify the mosaic, such as target name, panorama name, theme name, etc. Valid values include "A - Z", "0 - 9" and underscore. Must always pad to 5 characters, using underscores as necessary.

**venue** = (1 character) Venue and Product Producer ID shared in the same field. See description  
**/who** and valid values for field "venue / who" in Section 6.1.1.

**ver** = (1 alphanumeric) Version identifier. The Version number increments by one whenever an otherwise-identical filename would be produced.

The valid values, in their progression that excludes "0" altogether, are as follows (non-Hex):

- Range 1 thru 9 - "1", "2", ... "9"
- Range 10 thru 35 - "A", "B", ... "Z"
- Range 36 and higher - "\_" (underscore)

Note that not every version need exist, e.g. versions 1, 2 and 4 may exist but not 3. In general, the highest-numbered Version represents the "best" version of that product.

NOTE: To be clear, this field increments independently of all fields, including the Special Processing field.

**ext** = (2 to 3 characters) Product type extension.

Valid values for nominal operations camera data products:

- "IMG" - Image EDRs / RDRs (ODL label, may include embedded VICAR label)
- "JPG" - JPEG compressed (detached label)
- "LIS" - ASCII filelist of component EDR / RDR filenames comprising the mosaic
- "NAV" - Navigation (geometric correction) file
- "BRT" - Brightness correction file
- "TIE" - Tiepoint file
- "OVR" - Overlap file

Example: N\_L000\_0060XILT005CYLTSG0104\_DRIVEM1.IMG

where,

instr1 =	"N"	= Navcam
instr2 =	" "	= No 2 <sup>nd</sup> instrument
eye =	"L"	= Left camera eye
filt =	"000"	= Non-filter camera
spec =	" "	= No special processing
sol =	"0060"	= Sol 60 as Sol of last (highest SCLK) input product
multsol =	"X"	= Flags Sol 60 as last of multiple Sols
prodid =	"ILT"	= Input products are ILUT RDRs
site =	"005"	= Site 5
proj =	"CYL"	= Cylindrical projection
geomcor =	"T"	= Geometric correction method is "manual tiepointing"
frame =	"S"	= Coordinate system (frame) is Site
britecor =	"G"	= Brightness correction method is "General" (manual)
drive =	"0104"	= Drive (Position-within-Site) 104
multdrive =	" "	= Flags Drive 104 as only Drive
mosid =	"DRIVE"	= Arbitrary string identifying product as type of Drive mosaic
venue / who =	"M"	= Identifies MIPL/OPGS as product provider
ver =	"1"	= Version 1
ext =	"IMG"	= Image product with ODL label

### 6.1.3 Unified Terrain Mesh RDR Filename

Each MSL unified Terrain Mesh RDR product can be uniquely identified by incorporating into the product filename the Instrument identifier, the Starting Sol and Ending Sol, the Product Type of the mesh surface texture (“skin”), the Geometry type (linearized vs nonlinearized), the Site and Drive, the camera Eye and a Version number. The filename complies to the PDS 36.3 standard and is variable length, due to the variable length of the Instrument identifier field. The convention is illustrated in Figure 6.1.3 below.

The filename convention follows:

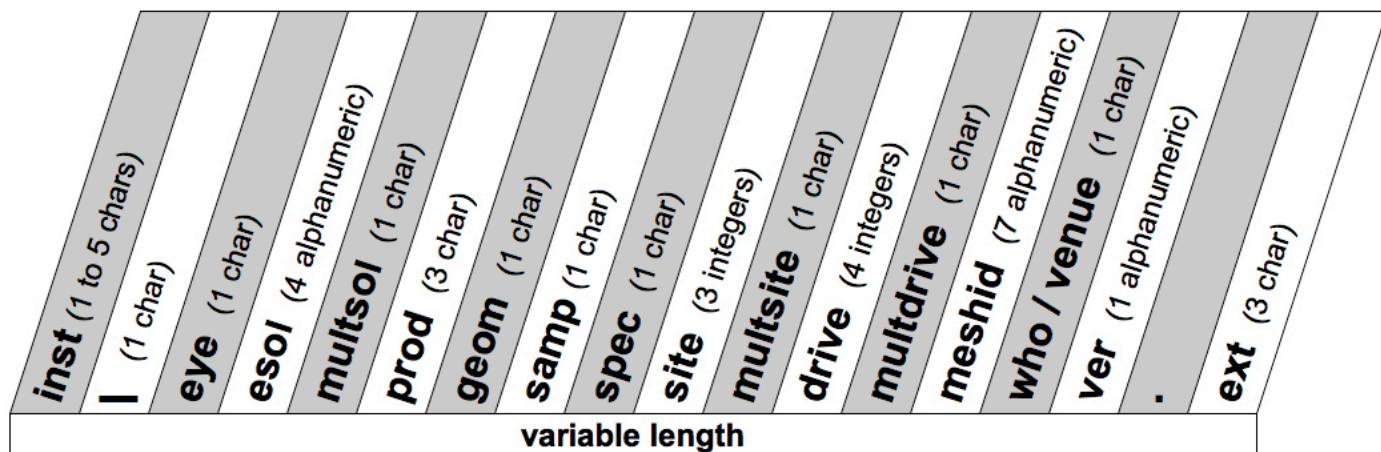

Figure 6.1.3 – “Unified” Terrain Mesh RDR Filename Convention

where,

**inst** = (1 to 5 characters) One or more Instrument ID's, denoting the source MSL science or engineering instrument(s) and/or orbiter that acquired the data. Note that if data were acquired by all six instruments, a single “A” character will appear instead. Valid values are:

“F” - Front Hazcam	“H” - MAHLI
“R” - Rear Hazcam	“O” - Orbiter
“N” - Navcam	“A” - All six instruments
“M” - MastCam	

**eye** = (1 character) Indicates Camera eye that was referenced during stereo correlation. Valid values are:

“L” - Left-to-right stereo correlation	“N” - Not applicable
“R” - Right-to-left stereo correlation	“X” - Mixed
“M” - Monoscopic (non-stereo camera)	

**esol** = (4 alphanumeric) Ending Sol (for simulated or nominal surface ops) or Day of Year (DOY, for some testbed activities) included in mesh. Indicates the Sol or DOY of the last (in time order, the highest SCLK) input image built into the mesh.

The valid values, in their progression, are as follows (non-Hex):

Sol / DOY	Range	Values
Sol	0000 thru 9999	“0000”, “0001”, ... “9999”
	10000 thru 10999	“A000”, “A001”, ... “A999”
	11000 thru 11999	“B000”, “B001”, ... “B999”
		•
		•
		•
DOY	33000 thru 33999	“X000”, “X001”, ... “X999”
	Value is out of range	“_____” (4 consecutive underscores)
	001 thru 365 (2012)	“Y001”, “Y002”, ... “Y365”
	001 thru 365 (2013)	“Z001”, “Z002”, ... “Z365”
	Value is out of range	“_____” (4 consecutive underscores)

**multsol** = (1 character) Flag indicating data content from multiple Sols. Valid values are:

- “ ” - Flags field Esol as solitary.
- “X” - Flags field Esol as last of multiple Sols.

**prodid** = (3 characters) Product type identifier of the mesh surface texture (“skin”). See description and valid values for field “prodid” in Section 6.1.1.

**geom** = (1 alphanumeric) Geometry type, used to differentiate products as having camera-induced distortion removed (“linearized”) or not removed (“non-linearized”). See description for field “geom” in Section 6.1.1.

Valid values are:

Non-linearized	Linearized	
	Nominal	Actual
“_”	“L” - “V”	“A” - “K”

**samp** = (1 character) Sample type, indicating how the data was sampled.

Valid values for Sample type are:

- “F” - Full frame raster data, full resolution
- “S” - Subframed raster data, full resolution
- “D” - Downsampled raster data, reduced resolution
- “M” - Mixed (Subframe and Downsampled) raster data, mixed resolution
- “T” - Thumbnail raster data, reduced resolution
- “B” - Bayer extraction subsampling (MMM only) raster data
- “Y” - Thumbnail Bayer extraction subsampling (MMM only) raster data
- “N” - Non-raster data

**spec** = (1 character) Special processing flag. See description for field “spec” in Section 6.1.1.

Valid values are:

Special Processing	Value
none	“_”
Special method types A-S and U-	“A” - “S”, “U” - “Z”
Best tactical Special method	“T”

**site** = (3 alphanumeric) Site location count, from the RMC. See description and valid values for field “site” in Section 6.1.1.

**multsite** = (1 character) Flag indicating data content from multiple Sites. Valid values are:

- “\_” - Flags field Site as solitary.
- “X” - Flags field Site as last of multiple Sites.

**drive** = (4 alphanumeric) Drive location count, from the RMC. See description and valid values for field “drive” in Section 6.1.1.

**multdrive** = (1 character) Flag indicating data content from multiple Drives (Positions). Valid values are:

- “\_” - Flags field Drive as solitary.
- “X” - Flags field Drive as last of multiple Drives.

**meshid** = (7 alphanumeric) General purpose Mesh identifier. Can be set to anything to help identify the Mesh, such as target name, panorama name, theme name, etc. Valid values include “A - Z”, “0 - 9” and underscore. For Meshes, this field must ensure uniqueness in like-named Mesh filenames of identical Site, Drive and Instrument specification. This varies from Mosid field used in Mosaics. Must always pad to 7 characters, using underscores as necessary.

Pipeline (automated) Use Case	Value
Hazcam content only	Last 7 digits of XYZ's SCLK
All other Instrument content (including Hazcam combined with other)	“AUTOGEN”

**venue** = (1 character) Venue and Product Producer ID shared in the same field. See description and valid values for field “venue / who” in Section 6.1.1.

**ver** = (1 alphanumeric) Version identifier. The Version number increments by one whenever an otherwise-identical filename is produced within N hours of the first version. The value of N is set at the discretion of the product provider. Therefore, all like-named products built within the N-hour window will carry the same Version, effectively overwriting the filename at each iteration.

The valid values, in their progression that excludes “0” altogether, are as follows (non-Hex):

- Range 1 thru 9 - “1”, “2”, ... “9”
- Range 10 thru 35 - “A”, “B”, ... “Z”
- Range 36 and higher - “\_” (underscore)

Note that not every version need exist, e.g. versions 1, 2 and 4 may exist but not 3. In general, the highest-numbered Version represents the most recent version of that product.

**ext** = (2 to 3 characters) Product type extension.

Valid values for nominal operations camera data products:

“**iv**” - Unified Terrain Mesh RDR in Inventor ASCII format (no label)

“**mod**” - ASCII index list of Mesh component “.ht” Height Map and “tile.iv” vertice files

Example: NFR\_L0060\_RASLF\_005\_0104\_AUTOGENM1.iv

where,

inst	=	<b>“NFR”</b>	=	Mesh comprised of Navcam, Front and Rear Hazcam data
delimeter	=	“ ”	=	Delimeter
eye	=	“L”	=	Left camera eye
esol	=	<b>“0060”</b>	=	Sol 60 as Sol of last (highest SCLK) input product
multsol	=	“ ”	=	Flags Sol 60 as only Sol
prodid	=	<b>“RAS”</b>	=	Terrain texture are contrast enhanced Rad-corrected RDRs
geom	=	“L”	=	“Linearized” input products without camera distortion
samp	=	“F”	=	Full frame, full resolution input products
spec	=	“ ”	=	No special processing
site	=	<b>“005”</b>	=	Site 5
multsite	=	“ ”	=	Flags Site 5 as only Site
drive	=	<b>“0104”</b>	=	Drive (Position-within-Site) 104
multdrive	=	“ ”	=	Flags Drive 104 as only Drive
meshid	=	<b>“AUTOGEN”</b>	=	Default string identifying nominal pipeline as the process
venue / who	=	“M”	=	Identifies MIPL/OPGS as product provider
ver	=	“1”	=	Version 1
ext	=	“iv”	=	Unified Terrain Mesh in Open Inventor format

## PDS Standards

The MSL camera instrument EDR data product complies with Planetary Data System standards for file formats and labels, as specified in the PDS Standards Reference [Ref 14]. See Section 4.2 for a description of the PDS Label and the specific conventions adopted by MSL.

## 6.2 Time Standards

The EDR PDS label uses keywords containing time values. Each time value standard is defined according to the keyword description. See Appendix F.

## 6.3 Coordinate Frame Standards

The MSL Frame Manager defines several dozen coordinate frames, which can be used for commanding pointing among other things. Refer to the Pointing, Positioning, Phasing and Coordinate Systems (PPPCS) document [Ref 1] or the Surface Attitude, Positioning and Pointing (SAPP) Functional Design Description (FDD) [Ref 2] for more details on all these coordinate frames. Only a few of them are used by the products and processes described by this SIS. This subset is described in detail in this section. The only place in this SIS where the full set of frames can appear is in the INSTRUMENT\_COORD\_FRAME\_ID label, which is a command echo.

A subset of these frames needed for a specific image or data set are defined by the \*\_COORDINATE\_SYSTEM groups.

Note that the PLACES database [Ref 10] maintains both telemetered and re-localized versions of the Site and Rover Nav frames at every available index.

**Table 6.4 - Coordinate Frames Used for MSL Surface Operations**

Frame Name (Label Keyword Value)	Short Name (SAPP FDD)	Reference Frame (Used to Define)	Coordinate Frame	
			Origin	Orientation
ROVER_NAV_FRAME	RNAV	Enclosing SITE_FRAME	Attached to rover	Aligned with rover
ROVER_MECH_FRAME	RMECH	Enclosing SITE_FRAME	Attached to rover	Aligned with rover
LOCAL_LEVEL_FRAME	LL	Enclosing SITE_FRAME	Attached to rover (coincident with Rover Nav Frame)	North/East/Nadir
SITE_FRAME	SITE(n)	Previous SITE_FRAME	Attached to surface	North/East/Nadir
RSM_HEAD_FRAME	RSM_HEAD	ROVER_NAV_FRAME	Attached to mast head	Aligned with pointing of mast head. This corresponds to RSM_HEAD in the Frame Manager
Arm Frames: ARM_TURRET_FRAME ARM_DRILL_FRAME ARM_DRT_FRAME ARM_MAHLI_FRAME ARM_APXS_FRAME ARM_PORTION_FRAME ARM_SCOOP_TIP_FRAME ARM_SCOOP_TCP_FRAME	Arm Frames: TURRET DRILL DRT MAHLI APXS PORTION SCOOP_TIP SCOOP_TCP	ROVER_NAV_FRAME	Attached to the tool; see PPPCS for the specific tool frame.	Aligned with tool in some way; see PPPCS [Ref 1] for the specific tool Frame.

### 6.3.1 Rover Navigation (Rover Nav) Frame

The Rover Nav frame (RNAV) is the one used for surface navigation and mobility. By definition, the frame is attached to the rover, and moves with it when the rover moves while on the surface. Its Y origin is centered on the rover and the X origin is aligned with the middle wheels' rotation axis for the deployed rover and suspension system on a flat plane. The Z origin is defined to be at the nominal surface, which is a fixed position with respect to the rover body. The actual surface will likely not be at exactly  $Z=0$  due to the effects of suspension sag, rover tilt, rocker bogie angles, etc. The  $+X$  axis points to the front of the rover,  $+Y$  to the right side, and  $+Z$  down (perpendicular to the chassis deck). See Figure 6.4.1.1.

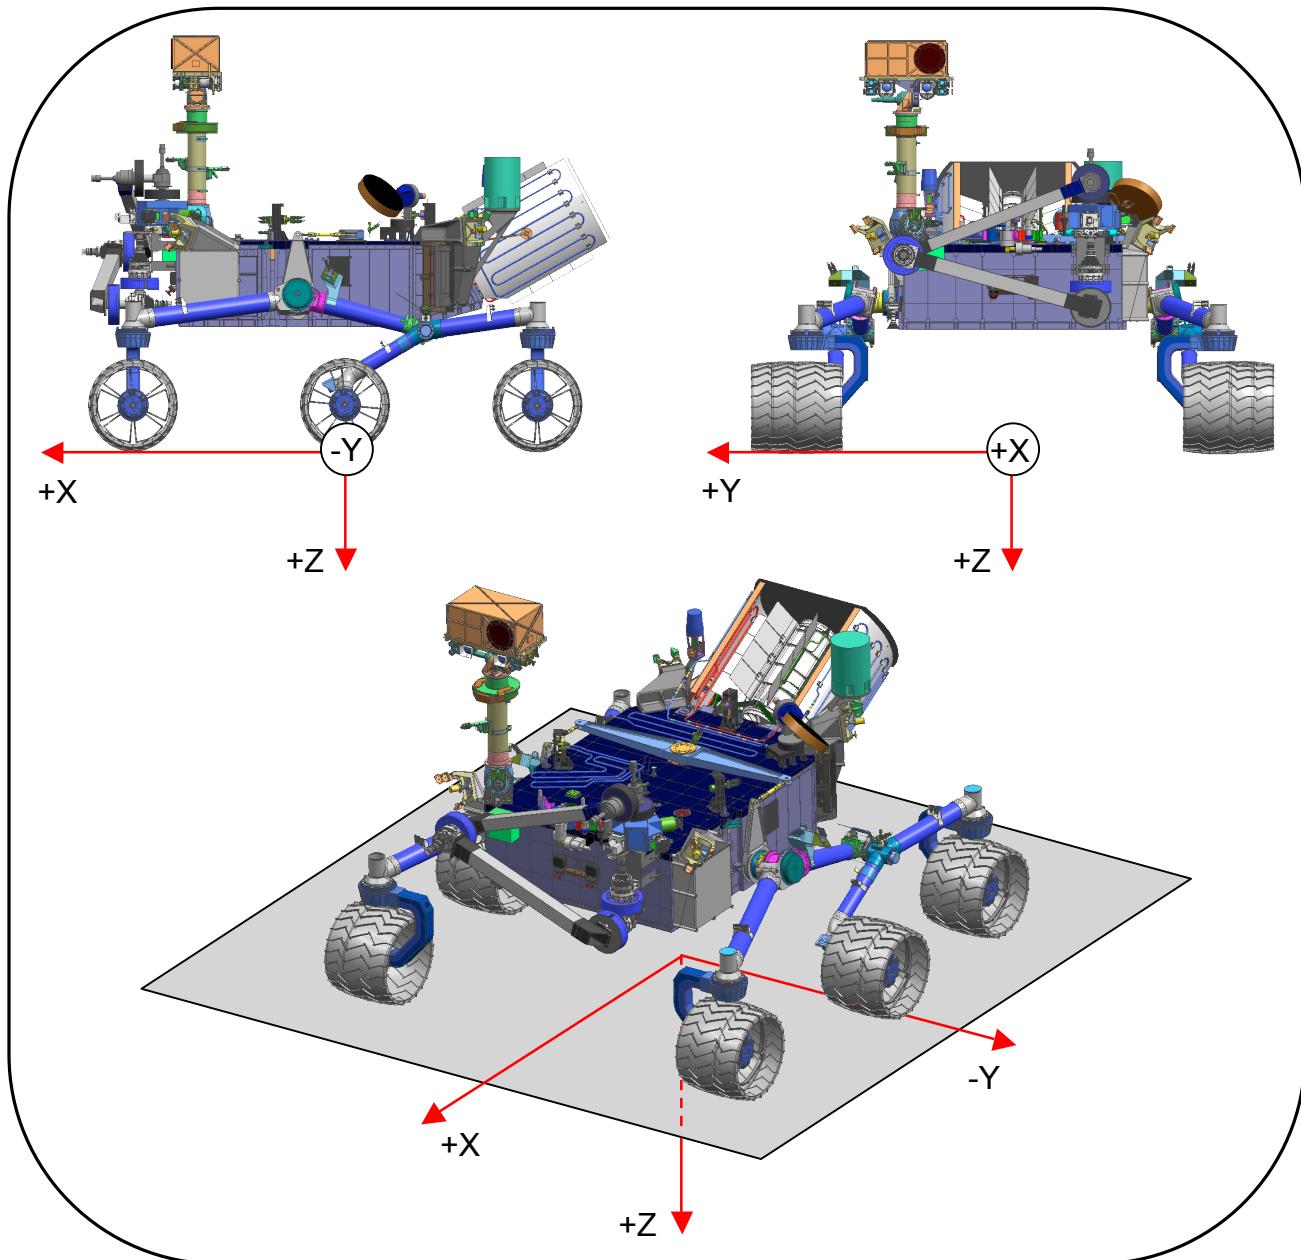

Figure 6.4.1.1 – Rover Navigation (RNAV) Coordinate Frame

The Rover Nav frame is specified via an offset from the current Site frame, and a quaternion that represents the rotation between the two. A new instance of the Rover Nav frame, with a potentially unique offset/quaternion, is created every time the ROVER\_MOTION\_COUNTER increments.

Orientation of the rover (and thus Rover Nav) with respect to Local Level or Site is also sometimes described by Euler angles as shown in Figure 6.4.1.2, where  $\psi$  is heading,  $\theta$  is attitude or pitch, and  $\phi$  is bank or roll.

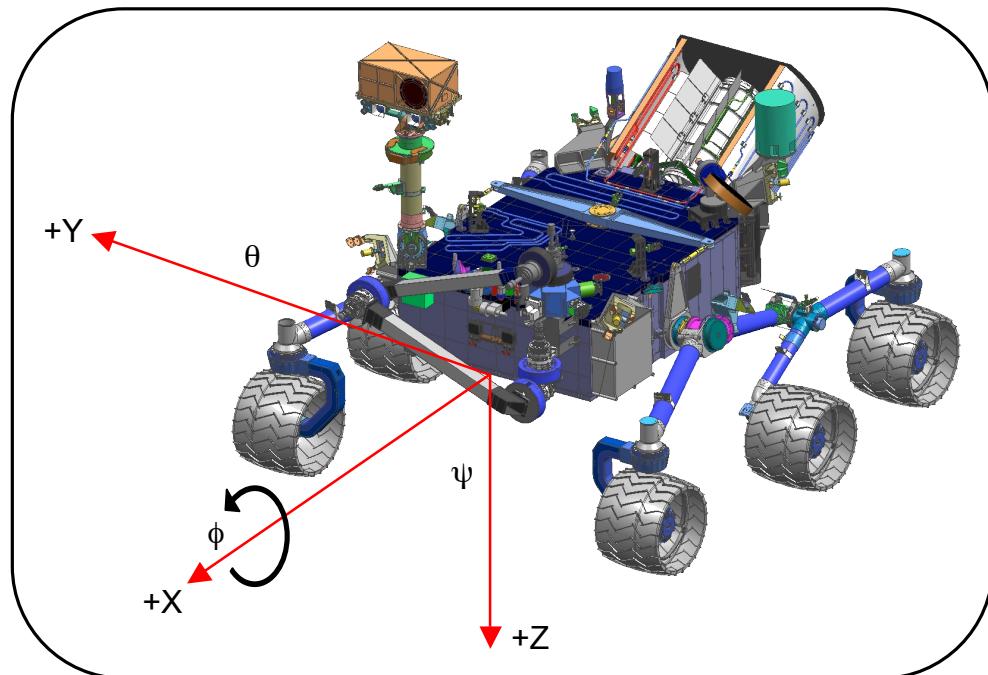

Figure 6.4.1.2 – Yaw, Pitch and Roll Definitions

### 6.3.2 Rover Mechanical (Rover Mech) Frame

The Rover Mechanical (RMECH) frame is oriented identically to the Rover Nav frame. The origin is forward of Rover Nav by  $x=0.09002$  meters. In other words, given a point expressed in Rover Mech, if you add  $(0.09002, 0.0, 0.0)$  you will get the same point expressed in Rover Nav. Rover Mech is not used by any nominal products (EDR or RDR) but could appear in certain special products, generally having to do with arm kinematics.

### 6.3.3 Local Level Frame

The Local Level frame is coincident with the Rover Nav frame, i.e. they share the same origin at all times. The orientation is different, however. The  $+X$  axis points North,  $+Z$  points down to nadir along the local gravity vector, and  $+Y$  completes the right-handed system. Thus the orientation matches the orientation of Site frames.

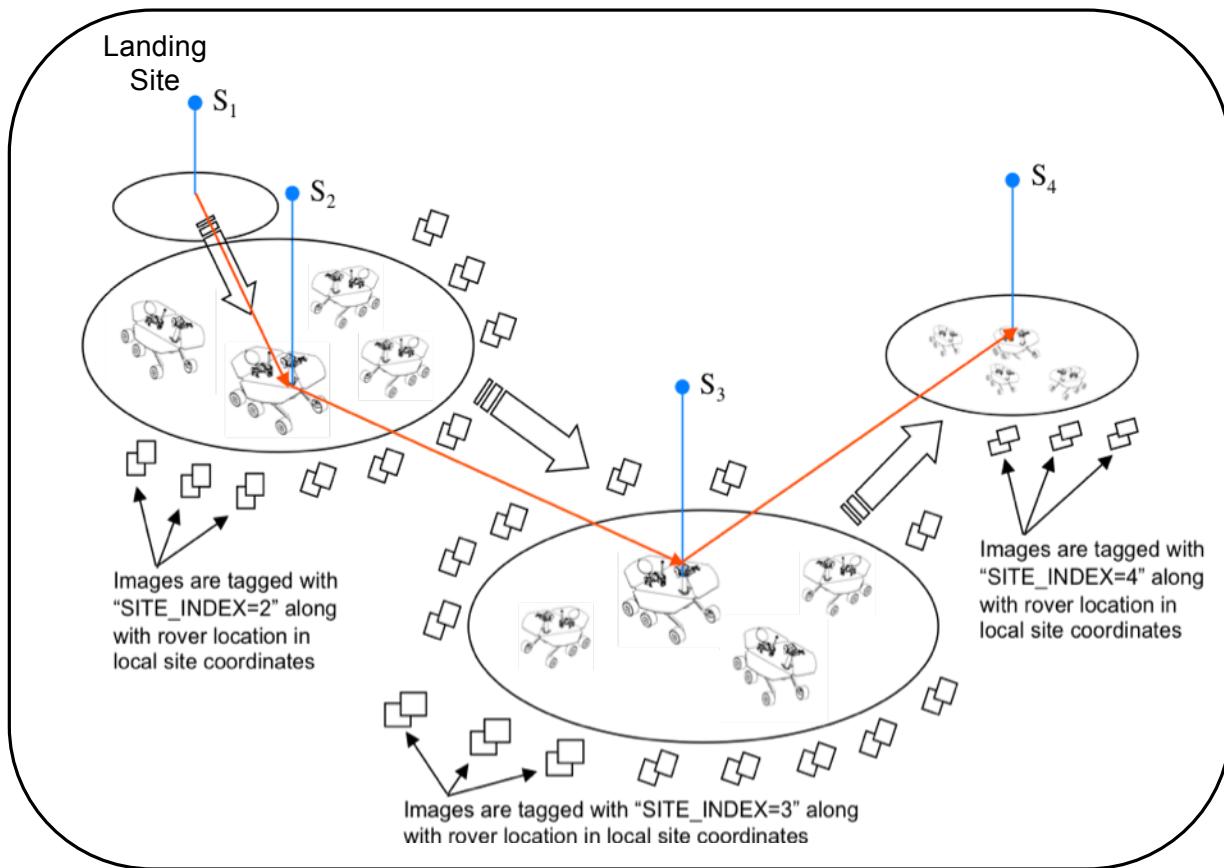

Local Level frames are defined by an offset from the current Site frame, with an identity quaternion.

### 6.3.4 Site Frame

Site frames are used to reduce accumulation of rover localization error. They are used to provide a common reference point for all operations within a local area. Rover Nav and Local Level frames are specified using an offset from this origin. When a new Site is declared, that becomes the new reference, and the offset is zeroed. In this way, long-term localization error is relegated to the offset between Sites, becoming irrelevant to local operations, because the positions are reset with each new Site.

When a Site frame is declared, it is identical to the Local Level frame, sharing both orientation and position. However, the Site frame is fixed to the Mars surface; when the rover moves, Local Level moves with it but Site stays put. Therefore, for the Site frame, +X points North, +Z points down to nadir along the local gravity vector, and +Y completes the right-handed system.

Sites are indexed, meaning there are multiple instances. Site 1 by definition represents the landing location. New Sites are declared as needed during operations, as the rover moves away from the local area. See Figure 6.4.4.

**Figure 6.4.4 – Site and Rover Frames**

The PLACES database [Ref 10] stores the set of all site-to-site offsets; such offsets are not in every image label.

### 6.3.5 RSM Frame

The RSM frame is attached to the Remote Sensing Mast (RSM) camera head, and moves with it. See the PPPCS for specific definition. It is expressed as an offset and quaternion from the Rover Nav frame.

### 6.3.6 Arm Frames

The frame representing the currently selected arm tool is reported in the arm coordinate system group. The selected tool, given by ARTICULATION\_DEV\_INSTRUMENT\_ID, is arbitrary for any given image and may be surprising; for example MAHLI may not be the selected tool for a MAHLI image. The various tool frames are attached to and aligned with the tool in some manner specific to that tool. See the PPPCS [Ref 1] for actual frame definitions.

## 7. APPLICABLE SOFTWARE

The instrument data downlink processing software is focused on rapid reduction, calibration, and visualization (in the case of images) of products in order to make discoveries, to accurately and expeditiously characterize the geologic environment around the rover, and to provide timely input for operational decisions concerning rover navigation and Arm target selection. Key software tools have been developed at JPL as part of the OPGS and APSS subsystems, and at LANL/IRAP/CNES by the ChemCam team. These toolsets can be used to process data to yield substantial scientific potential in addition to their operational importance.

### 7.1 Utility Programs

Table 7.1 lists (in no particular order) the primary software tools that will be used to process and manipulate downlinked MSL instrument payload data. Instrument data processing software executed by teams working the OPGS and APSS subsystems at JPL will be capable of reading and writing image and spectra data in PDS format. Within OPGS, the “msledrgen” program will generate EDRs and the Mars Program Suite of VICAR programs will generate RDRs in PDS format. An OPGS pipeline system will deliver the products to the FEI server for transfer to MSL’s ODS as rapidly as possible after receipt of telemetry.

**Table 7.1 - Key Software Toolsets**

Name	Description	Primary Development Responsibility
ChemCam Ops Software	LIBS software development is primarily performed in IDL code, with LANL (New Mexico) as lead institute.	Dot Delapp (LANL)
	RMI software development is primarily performed in IDL code, with IRAP (France) as lead institute.	David Baratoux (IRAP)
msledrgen	Fetches the image Data Product Object (DPO) records from MSL Data Product (DP) files, reconstructing the image file from the telemetry data into a PDS-labelled image EDR data product. VICAR code.	Alice Stanboli, Costin Radulescu(JPL / MIPL)
Mars Program Suite	<p>Stereo image processing software using EDRs or calibrated images (RDRs), image mosaicking software, 3-D terrain building software. VICAR code:</p> <ul style="list-style-type: none"> <li>• MARSCAHV – Generates a geometrically corrected version of the EDR, applying the C, A, H and V camera model vectors.</li> <li>• MARSRAD – Generates a radiometrically corrected image from a single input EDR.</li> <li>• MARSJPLSTEREO – Generates a disparity map from a stereo pair of input EDRs, applying a 1-D correlator (fast).</li> <li>• MARSCOR3 – Generates a disparity map from a stereo pair of input EDRs, applying a 2-D correlator (more robust).</li> <li>• MARSXYZ – Generates an XYZ image from an input disparity map.</li> <li>• MARS RANGE – Generates a range image from an input XYZ map.</li> <li>• MSLREACH – Generates an arm reachability map from an input XYZ map.</li> <li>• MARSINVERTER – Generates inverse lookup table (ILUT) products.</li> <li>• MARSDEBAYER – Generates de-Bayered images.</li> <li>• MSLROUGH – Generates roughness maps.</li> <li>• MARSERROR – Generates XYZ and range error maps.</li> <li>• MARSSLOPE – Generates slope maps.</li> <li>• MARSBRT – Generates brightness/contrast correction file for mosaic processing.</li> <li>• MSLFILTER – Generates XML file for image mask files.</li> <li>• MARS FILTER – Generates image mask files.</li> <li>• MARSMASK – Applies image mask files to image files.</li> <li>• MARSDISPCOMPARE – Checks consistency for left-to-right and right-to-left stereo image correlations.</li> <li>• MARSUVW - Generates a surface normal image, wherein XYZ is computed normal to the surface.</li> <li>• MARSMAP – Generates a Cylindrical, Polar or Vertical projection mosaic from a list of input EDRs.</li> <li>• MARSMOS – Produces pinhole camera mosaics using uncorrected input images and CAHVOR camera model.</li> <li>• MARSMCAULEY – Generates a combination Cylindrical-Perspective projection mosaic from a list of input EDRs.</li> <li>• MARSTIE – Generates pointing corrections (tiepoint file) from an overlapping set of input EDRs.</li> <li>• MARSNAV – Generates an updated azimuth and elevation file based on comparison with existing image data that can be directly compared.</li> </ul>	Bob Deen (JPL / MIPL)

Name	Description	Primary Development Responsibility
	<ul style="list-style-type: none"> <li>• XVD – De facto image reader software capable of displaying VICAR-labeled image files.</li> <li>• CRUMBS – 3-D terrain building software</li> </ul>	Oleg Pariser (JPL / MIPL)
APSS / MSLICE	Visualization and planning software for creation of science products and candidate observations for presentation at Ops planning meetings, and then Sol activity list at end of planning meetings. Java code.	Mark Powell (JPL)
APSS / RSVP	Visualization, planning, and sequence generation software for use by Sequence Team to create Sol sequences based on activity lists generated by PSI during planning meetings. Java, C and C++ code.	Brian Cooper (JPL)

## 7.2 Applicable PDS Software Tools

PDS-labeled images and tables can be viewed with the program NASAView, developed by the PDS and available for a variety of computer platforms from the PDS web site [http://pds.jpl.nasa.gov/tools/software\\_download.cfm](http://pds.jpl.nasa.gov/tools/software_download.cfm). There is no charge for NASAView.

## 7.3 Software Distribution and Update Procedures

The FEI distribution tool and Mars Image Processing Program Suite are available to researchers and academic institutions. Refer to the MIPL Web site at <http://www-mipl.jpl.nasa.gov> for contact information. FEI is described in detail at <http://www-mipl.jpl.nasa.gov/MDMS.html>

# APPENDIX A - Composite EDR / RDR Label (ODL / PDS format)

## PDS Label Symbols (displayed next to Keyword or Value)

= Keyword present in detached PDS label, but with "MSL:" prepended to name

= Keyword not present in detached PDS label

[ ] = Specifies the Keyword or Value or Group in detached PDS label, when different than ODL label

NOTE: If no symbol is displayed, then Keyword is present in detached PDS label as shown for the ODL label. OPGS-generated products with MMM content have no PDS label.

## ODL & VICAR Primary Label Symbols (displayed in matrix)

= Keyword not present in any label

• = Keyword present in all labels that exist. For RDRs, keyword matches source product (if not in source product, then keyword is not present)

## ODL & VICAR Secondary Label Symbols (displayed in matrix)

o = Keyword present in attached/detached **ODL** label only, and not present in VICAR label (if it exists)

a = Keyword present in **attached** ODL label only, and not present in detached ODL label or VICAR label (if it exists)

p = Keyword present in detached **PDS** label only; no existing ODL label or VICAR label

d = Keyword present in all labels, with value **different** from source EDR

r = Keyword present only if **relevant** and therefore optional (such as camera model vector keywords MODEL\_COMPONENT\_n in Group GEOMETRIC\_CAMERA\_MODEL)

m = Keyword present in labels for **MMM** products only

## Products Grouped by Identical Label Keywords

### UDR Groups

**MMM:** Mcam\*, Mhli\*, Mrdi\*

### EDR Groups

**RMI:** CcamRmi\*    **LIBS A:** CcamSpectra    **LIBS B:** CcamSpectraStats    **SOH:** CcamSoh\* (no CcamSohSunSafe)    **Sun Safe:** CcamSohSunSafe

**Util Test:** CcamUtilTest    **Eng. Cameras:** Img\*    **MMM A:** Mcam\*, Mhli\*, Mrdi\* (no \*Video or \*Zstack)    **MMM B:** Mcam\*Video, Mhli\*Video, Mrdi\*Video

**MMM C:** Mcam\*Zstack, Mhli\*Zstack, Mrdi\*Zstack

### RDR Groups

**RMI:** CcamRmi\*    **LIBS A:** CcamSpectra    **LIBS B:** CcamSpectraStats    **XYZ:** XYZ, Surface Normal, Surface Roughness

**Arm Reach:** Reachability, Pre-load    **Mosaic ORT:** Orthographic, Orthorectified

**Ops Labelless:** Mosaic Ancillary ("LIS", ".NAV", ".BRT") & Terrain Per-XYZ ("iv", ".ht", ".rgb") & Terrain Unified ("iv", ".mod")

<p><b>Ops Keyword</b> ARTICULATION_DEVICE_ANGLE</p> <p><b>PDS Keyword</b> same</p> <p><b>Definition</b> Specifies the value of an angle between two parts or segments of an articulated device.</p> <p>NOTE: MSL uses radians. The PDS default unit for this keyword is degrees, so the &lt;rad&gt; tag is required.</p> <p>For the RSM, the "MEASURED" values (see ARTICULATION_DEVICE_ANGLE_NAME) represent the value of the resolver (attached to the output side of the joint), while the "FINAL" values represent the encoder (attached to the motor). The resolver should be preferentially used if available, as it measures the angle after joint backlash. A value of 1e+30 indicates the angle is not available, in which case the encoder should be used instead. Note that the "INITIAL" and "REQUESTED" values are also encoder measurements, and could be used to determine the joint's direction of motion for backlash determination.</p>	<p><b>TELEMETRY (Class)</b></p> <p><b>Valid Values</b> n/a</p> <p><b>Type</b> 1) float array[8] 2) float array[2] 3) float array[6] 4) float array[10]</p> <p><b>Units</b> radians (&lt;rad&gt; unit tag required)</p> <p><b>Location</b> 1) CHASSIS_ARTICULATION_STATE (Group) 2) HGA_ARTICULATION_STATE (Group) 3) RSM_ARTICULATION_STATE (Group) 4) ARM_ARTICULATION_STATE (Group)</p>	<p><b>Mode</b> DPO in XML format (referenced to APID Name in Appendix E)</p> <p><b>Field as "&lt;xml name&gt;:[&lt;element&gt;]:[&lt;element&gt;]:&lt;field&gt;"</b></p> <ul style="list-style-type: none"> <li><b>Eng. <b>PDS Keyword</b> MSL:CONFIGURATION_BIT_ID	<u>Type</u> string array[8]	<b>Field as “&lt;xml name&gt;:[&lt;element&gt;]:[&lt;element&gt;]:&lt;field&gt;”</b> n/a
<b>Definition</b> Specifies an array of strings identifying the configuration of the arm represented by the bits in the reachability product. Each configuration requires 2 bits to describe. The first entry in the array contains the configuration for the 2 most significant bits, while the last entry contains the configuration for the 2 least significant bits.  For MSL, the instrument/tools that are useful in a reachability map are DRILL, DRT, MAHLI, APXS and SCOOP_TIP.  For MSL, the 8 configuration values are interpreted as follows: a) “ARM_SO_EU_WU” - Shoulder out, Elbow up, Wrist up. b) “ARM_SO_EU_WD” - Shoulder out, Elbow up, Wrist down. c) “ARM_SO_ED_WU” - Shoulder out, Elbow down, Wrist up. d) “ARM_SO_ED_WD” - Shoulder out, Elbow down, Wrist down. e) “ARM_SI_EU_WU” - Shoulder in, Elbow up, Wrist up. f) “ARM_SI_EU_WD” - Shoulder in, Elbow up, Wrist down.	<u>Units</u> n/a  <u>Location</u> DERIVED_IMAGE_PARMS (Group)	<b>Type</b> n/a

<p><b>Ops Keyword</b> EXPOSURE_SCALE_FACTOR</p> <p><b>PDS Keyword</b> same</p> <p><b>Definition</b> Specifies a multiplier to the base exposure time. The base exposure time is either user-commanded or is read from the onboard exposure time table. The resulting number is used by the cameras as the actual commanded exposure time. This scale factor is commonly used during multi-spectral imaging, when the base exposure time is known for one filter and EXPOSURE_SCALE_FACTOR is used to scale the exposure time to levels appropriate for the other filters.</p>	<p><b>Valid Values</b></p> <ul style="list-style-type: none"> <li>• MMM Cameras "N/A"</li> </ul> <p><b>Type</b> float</p> <p><b>Units</b> n/a</p> <p><b>Location</b> OBSERVATION_REQUEST_PARMS (Group)</p> <p><b>Mode</b> DPO in XML format (referenced to APID Name in Appendix E)</p> <p><b>Field as "&lt;xml name&gt;:[&lt;element&gt;]:[&lt;element&gt;]:&lt;field&gt;"</b></p> <p>Eng. <b>Definition</b> This keyword describes the mode of image acquisition. Valid values are defined as: a) "NONE" - No image acquired b) "SERNO" - No image acquired, camera serial number returned only c) "IMAGE" - The image was acquired  For MSL, there are two acquisition modes pertaining to camera data: "IMAGE" and "SERNO".  The normal mode ("IMAGE") acquires and transmits the image according to all the command parameter settings.  The "SERNO" case is a mode of acquisition that does just enough to get the camera's hardware serial number. Normally, such a mode should result in a data product with a header only and no image. However, the IMG onboard software supercedes during acquisition and acquires data in hardware windowed mode, resulting in a single row of an image. So, ground processing of the data product will yield a value of 1 for "hw_numrows", but the actual image is still set as 0 rows and 0 columns.	<u>Units</u> n/a  <u>Location</u> IDENTIFICATION (Class)	<u>Type</u> enum

<p>Local mean solar time is defined, by analogy with Local True Solar Time (LTST), as the difference between the areocentric right ascensions of a point on the surface and of the FMS. The difference between LTST and LMST varies over time. The length of a mean solar day is constant and can be computed from the mean motion of the FMS and the rotation rate of a planet. The mean solar day is also called a 'Sol'. Mean solar hours, minutes, and seconds are defined in the same way as the true solar units.</p> <p>For MSL, the valid value is embedded with a Sol value that can be different than the Sol (see PLANET_DAY_NUMBER) associated with LTST (see LOCAL_TRUE_SOLAR_TIME). The time portion of the valid value is expressed in terms of a 24-hour clock. So, in an example using Sol 27, the valid value range for the 24-hour clock would be represented as "Sol-00027M00:00:00.000" to "Sol-00027M23:59:59.999".</p>		<p>a. <p><b>Ops Keyword</b> LOCAL_TRUE_SOLAR_TIME</p> <p><b>PDS Keyword</b> same</p> <p><b>Definition</b> Specifies the local true solar time, or LTST. It is one of two types of solar time used to express the time of day at a point on the surface of a planetary body. LTST is measured relative to the true position of the Sun as seen from a point on the planet's surface.</p> <p>The coordinate system used to define LTST has its origin at the center of the planet. Its Z-axis is the north pole vector (or spin axis) of the planet. The X-axis is chosen to point in the direction of the vernal equinox of the planet's orbit. (The vernal or autumnal equinox vectors are found by searching the planetary ephemeris for those times when the vector from the planet's center to the Sun is perpendicular to the planet's north pole vector. The vernal equinox is the time when the Sun appears to rise above the planet's equator.)</p> <p>Positions of points in this frame can be expressed as a radius and areocentric 'right ascension' and 'declination' angles. The areocentric right ascension angle, or ARA, is measured positive eastward in the equatorial plane from the vernal</p>	<p><b>Valid Values</b> &lt;hh&gt;:&lt;mm&gt;:&lt;ss&gt;[.&lt;fff&gt;]</p> <p>NOTE: Value will be uncalibrated if SPICE kernels unavailable.</p> <p><b>Type</b> string(12)</p> <p><b>Units</b> n/a</p> <p><b>Location</b> IDENTIFICATION (Class)</p>	<p><b>Mode</b></p> <ol style="list-style-type: none"> <li>a. OUTPUT METADATA (PRODUCT LABEL)		INPUT METADATA (SOURCE)				
<ul style="list-style-type: none"> <li>Ops Keyword</li> <li>PDS-Compliant Keyword</li> <li>Definition</li> </ul> <p>equinox vector to the intersection of the meridian containing the point with the equator. Similarly, the areocentric declination is the angle between the equatorial plane and the vector to the point. LTST is a function of the difference between the ARAs of the vectors to the Sun and to the point on the planet's surface. Specifically,</p> $\text{LTST} = (\text{a}(P) - \text{a}(TS)) * (24 / 360) + 12$ <p>where,  <math>\text{LTST}</math> = the local true solar time in true solar hours  <math>\text{a}(P)</math> = ARA of the point on the planet's surface in deg  <math>\text{a}(TS)</math> = ARA of the true sun in deg</p> <p>The conversion factor of 24/360 is applied to transform the angular measure in decimal degrees into hours-minutes-seconds of arc. This standard representation divides 360 degrees into 24 hours, each hour into 60 minutes, and each minute into 60 seconds of arc. The hours, minutes, and seconds of arc are called 'true solar' hours, minutes, and seconds when used to measure LTST. The constant offset of 12 hours is added to the difference in ARAs to place local noon (12:00:00 in hours, minutes, seconds) at the point where the Sun is directly overhead; at this time, the ARA of the true sun is the same as that of the surface point so that</p> $\text{a}(P) - \text{a}(TS) = 0.$ <p>The use of 'true solar' time units can be extended to define a true solar day as 24 true solar hours. Due to the eccentricity of planetary orbits and the inclination of orbital planes to equatorial planes (obliquity), the Sun does not move at a uniform rate over the course of a planetary year. Consequently, the number of SI seconds in a true solar day, hour, minute or second is not constant.</p> <p>For MSL, the valid value is expressed in terms of a 24-hour clock, so the acceptable range is "00:00:00.000" to "23:59:59.999".</p> <p>See also LOCAL_MEAN_SOLAR_TIME and PLANET_DAY_NUMBER.</p>	<ul style="list-style-type: none"> <li>Valid Values (quoted)</li> <li>Type</li> <li>Units</li> <li>Keyword Location in Label</li> </ul>	<ul style="list-style-type: none"> <li>Mode</li> <li>Metadata Field</li> <li>Type</li> </ul> <p>comprised of four bytes coming from Image DPO mini-header at byte offsets 8, 9, 10 and 11 per case "2a".</p> <ul style="list-style-type: none"> <li>For MMM non-recovered and non-Z-stack data products, if IDPH is present, value comes from IDPH DPO per case "2b".</li> <li>For MMM non-recovered and non-Z-stack data products, if IDPH is not present, value comes from Ancillary DPO per case "2c".</li> </ul> <p><b>Type</b> U32</p>

<p><b>Ops Keyword</b> ORIGIN_ROTATION_QUATERNION</p> <p><b>PDS Keyword</b> same</p> <p><b>Definition</b> Specifies an array of four values that specifies the rotation of the coordinate system being defined by the enclosing COORDINATE_SYSTEM group, relative to the reference system. Mathematically this can be expressed as follows:</p> <p>Given a vector expressed in the current frame, multiplication by this quaternion will give the same vector as expressed in the reference frame.</p> <p>Quaternions are expressed as a set of four numbers in the order:  <math>(s, v_1, v_2, v_3)</math>  where,  <math>s = \cos(\theta/2)</math>  <math>v(n) = \sin(\theta/2) \cdot a(n)</math>.  <math>\theta</math> = the angle of rotation  <math>a = (x, y, z)</math> vector around which rotation occurs</p> <p>Note that quaternions have different component order conventions between flight and ground software. They are received in the order "(v1, v2, v3, s)". However, the ground order convention is "(s, v1, v2, v3)", and all values are converted to the ground order before being stored in the label.</p> <p>For MSL, the value for ORIGIN_ROTATION_QUATERNION that defines a coordinate frame like Rover frame is computed with respect to only the orientations of the frame's axes... regardless of whether POSITIVE_ELEVATION_DIRECTION is declared to be "UP" or "DOWN".</p> <p>For MSL, here is an example:</p>	<p>e. <b>Definition</b> Specifies a set of integers which describe a (potentially) unique location (position/orientation) for a rover. Each time something happens that moves, or could potentially move, the rover, a new motion counter value is created. This includes intentional motion due to drive commands, as well as potential motion due to other articulating devices, such as arms or antennae. This motion counter (or part of it) is used as a reference to define instances of coordinate systems which can move such as SITE or ROVER frames. The motion counter is defined in a mission-specific manner. Although the original intent was to have incrementing indices (e.g. MER), the motion counter could also contain any integer values which conform to the above definition, such as time or spacecraft clock values.  For MSL, the motion counter consists of ten values. In order, they are “Site”, “Drive”, “Pose”, “Arm”, “CHIMRA”, “Drill”, “RSM”, “HGA”, “DRT”, and “IC”. The Site value increments whenever a new major Site frame is declared. The Drive value increments any time intentional driving is done. Each of those, along with Pose, resets all later indices to 0 when they increment.  The Arm, CHIMRA, DRILL, RSM, HGA, DRT and IC increment whenever the corresponding articulation device moves. These all increment independently of each other; they are reset to zero only when the SITE or DRIVE or POSE changes.	<b>Units</b> n/a	<b>Type</b> U16

<u><b>Ops Keyword</b></u> <b>SOLUTION_ID</b>  <u><b>PDS Keyword</b></u> <b>MSL:SOLUTION_ID</b>  <u><b>Definition</b></u> <p>Specifies the unique identifier for the solution set to which the values in the group belong.</p> <p>For certain kinds of information, such as pointing correction (pointing models) and rover localization (coordinate system definitions), the "true" value is unknown and only estimates of the true value exist. Thus, more than one set of estimates may exist simultaneously, each valid for its intended purpose. Each of these sets is called a "solution" to the unknown true value. SOLUTION_ID is used to identify which solution is being expressed by the containing group.</p> <p>No specific naming convention is defined here, however it is recommended that projects adopt one. The intent is to be able to identify who created the solution, and why. Possible components of the naming convention include user, institution, purpose, request ID, version, program, date/time. The value is not case-sensitive.</p> <p>For MSL, when in a COORDINATE_SYSTEM group, the SOLUTION_ID specifies the ID of the coordinate system being defined in that group. It must be globally unique across all coordinate system instances, i.e. it cannot be reused to define the same coordinate system instance differently. Different coordinate system instances (for example, different values of the RMC index) may share the same SOLUTION_ID.</p> <p>See also REFERENCE_COORD_SYSTEM_NAME and REFERENCE_COORD_SYSTEM_SOLN_ID. The SOLUTION_ID should be the same identifier used in the PLACES rover localization database. The special name</p>	<u><b>Valid Values</b></u> <ul style="list-style-type: none"> <li><u>EDR-generating software</u> "TELEMETRY"</li> <li><u>RDR-generating software</u> any string value</li> </ul> <u><b>Type</b></u> string  <u><b>Units</b></u> n/a  <u><b>Location</b></u> <ul style="list-style-type: none"> <li>For EDRs ... <ul style="list-style-type: none"> <li>- ROVER_COORDINATE_SYSTEM (Group)</li> <li>- RSM_COORDINATE_SYSTEM (Group)</li> <li>- ARM_COORDINATE_SYSTEM (Group)</li> </ul> </li> <li>For RDRs ... <ul style="list-style-type: none"> <li>- ROVER_COORDINATE_SYSTEM (Group)</li> <li>- RSM_COORDINATE_SYSTEM (Group)</li> <li>- ARM_COORDINATE_SYSTEM (Group)</li> <li>- SITE_COORDINATE_SYSTEM (Group)</li> <li>- LOCAL_LEVEL_COORDINATE_SYSTEM (Group)</li> <li>- DERIVED_IMAGE_PARMS (Group)</li> </ul> </li> </ul>	<u><b>Mode</b></u> <ul style="list-style-type: none"> <li>EDR-generating software: <ul style="list-style-type: none"> <li>- Static Value</li> </ul> </li> <li>RDR-generating software: <ul style="list-style-type: none"> <li>- Determined</li> </ul> </li> </ul> <p><b>Field as "&lt;xml name&gt;:[&lt;element&gt;]:[&lt;element&gt;]:&lt;field&gt;"</b></p> <p>n/a</p> <u><b>Type</b></u> n/a

<p><b>Ops Keyword</b> VIRTUAL_CHANNEL_ID</p> <p><b>PDS Keyword</b> MSL:VIRTUAL_CHANNEL_ID</p> <p><b>Definition</b> The Virtual Channel Identifier is used by MSL to identify the RCE string generating the Transfer Frame, and to indicate the type of data flowing in the telemetry virtual channel. RCE String A is indicated by all Virtual Channel Identifier values having a '0' as the high bit (e.g., virtual channels 0 to 31); RCE String B is indicated by all Virtual Channel Identifier values having a '1' for the high bit (e.g., virtual channels 32 to 63).</p>	<p><b>Valid Values</b> "0" to "63"</p> <p><b>Type</b> string</p> <p><b>Units</b> n/a</p> <p><b>Location</b> TELEMETRY (Class)</p>	<p><b>Mode</b> EMD in XML format</p> <p><b>Field as</b> "<code>&lt;xml name&gt;:[&lt;element&gt;]:[&lt;element&gt;]:&lt;field&gt;</code>"</p> <p>"MSlEarthProductMetadata:MsIPProductMetadata:Vcid"</p> <p><b>Type</b> n/a</p>
<p><b>Ops Keyword</b> X_AXIS_MAXIMUM</p> <p><b>PDS Keyword</b> same</p>	<p><b>Valid Values</b> n/a</p> <p><b>Type</b> float</p>	<p><b>Mode</b> RDR-generating software</p> <p><b>Field as</b> "<code>&lt;xml name&gt;:[&lt;element&gt;]:[&lt;element&gt;]:&lt;field&gt;</code>"</p> <p>n/a</p>

<ul style="list-style-type: none"> <li>• Ops Keyword</li> <li>• PDS-Compliant Keyword</li> <li>• Definition</li> </ul>	<ul style="list-style-type: none"> <li>• Valid Values (quoted)</li> <li>• Type</li> <li>• Units</li> <li>• Keyword Location in Label</li> </ul>	<ul style="list-style-type: none"> <li>• Mode</li> <li>• Metadata Field</li> <li>• Type</li> </ul>
<p><b>Definition</b> Specifies the image line representing 0.0 degree elevation.</p> <p>Applies to Cylindrical projections.</p>	<p><b>Units</b> pixel (&lt;pixel&gt; unit tag required)</p> <p><b>Location</b> SURFACE_PROJECTION_PARMS (Group)</p>	<p><b>Type</b> n/a</p>
<p><b>Ops Keyword</b> ZERO_EXPOSURE_IMAGE_ID</p> <p><b>PDS Keyword</b> MSL:ZERO_EXPOSURE_IMAGE_ID</p> <p><b>Definition</b> Specifies the value of PRODUCT_ID for the zero-exposure EDR that is subtracted during RDR generation to account for shutter smear and masked-region dark current.</p> <p>NOTE: This keyword is only placed in the PDS label if a zero-exposure image EDR product was used during on-ground calibration. It is not set when on-board shutter-subtraction is done.</p>	<p><b>Valid Values</b> n/a</p> <p><b>Type</b> string</p> <p><b>Units</b> n/a</p> <p><b>Location</b> DERIVED_IMAGE_PARMS (Group)</p>	<p><b>Mode</b> RDR-generating software</p> <p><b>Field as "&lt;xml name&gt;:[&lt;element&gt;]:[&lt;element&gt;]:&lt;field&gt;"</b> n/a</p> <p><b>Type</b> n/a</p>

## APPENDIX G – Label Keywords Omitted from PDS Label

Label Keyword Name Omitted from PDS label	ODL Label Location
ODL_VERSION_ID	1 <sup>st</sup> label record
STEREO_BASELINE	Group DERIVED_IMAGE_PARMS
CAMERA_SERIAL_NUMBER	Group GEOMETRIC_CAMERA_MODEL
MAGIC_NUMBERS	Group MINI_HEADER
MODEL_TRANSFORM_QUATERNION	Group GEOMETRIC_CAMERA_MODEL
MODEL_TRANSFORM_VECTOR	Group GEOMETRIC_CAMERA_MODEL
ICT_DIVIDER	Group OBSERVATION_REQUEST_PARMS
IPBC_DIVIDER	Group OBSERVATION_REQUEST_PARMS
N_SHOTS	Group OBSERVATION_REQUEST_PARMS
N_SHOTS_2_AVG	Group OBSERVATION_REQUEST_PARMS
N_SHOTS_2_IGNORE	Group OBSERVATION_REQUEST_PARMS
OBS_FROM_LIMIT_SWITCH	Group OBSERVATION_REQUEST_PARMS
SPEC_AD_CONVERTUV	Group OBSERVATION_REQUEST_PARMS
SPEC_AD_CONVERTVIS	Group OBSERVATION_REQUEST_PARMS
SPEC_AD_CONVERTVNIR	Group OBSERVATION_REQUEST_PARMS
SPEC_IMAGE_TYPE	Group OBSERVATION_REQUEST_PARMS
SPEC_VERT_CLK	Group OBSERVATION_REQUEST_PARMS
SPECTROMETER_CONTROL_BYTE	Group OBSERVATION_REQUEST_PARMS
SPECTROMETER_SELECT	Group OBSERVATION_REQUEST_PARMS
SPECTROMETER_SERIAL_CLOCK	Group OBSERVATION_REQUEST_PARMS
STACK_1_LEVEL	Group OBSERVATION_REQUEST_PARMS
STACK_2_LEVEL	Group OBSERVATION_REQUEST_PARMS
STACK_3_LEVEL	Group OBSERVATION_REQUEST_PARMS
STACK_DURATION	Group OBSERVATION_REQUEST_PARMS
START_ROW_UV	Group OBSERVATION_REQUEST_PARMS
STOP_ROW_UV	Group OBSERVATION_REQUEST_PARMS
START_ROW_VIS	Group OBSERVATION_REQUEST_PARMS
STOP_ROW_VIS	Group OBSERVATION_REQUEST_PARMS
START_ROW_VNIR	Group OBSERVATION_REQUEST_PARMS
STOP_ROW_VNIR	Group OBSERVATION_REQUEST_PARMS
TIME_BETWEEN_SHOTS	Group OBSERVATION_REQUEST_PARMS
INST_CMPRS_DEFERRED_FLAG	Groups IMAGE_REQUEST_PARMS, THUMBNAIL_REQUEST_PARMS, REFERENCE_PIXEL_REQUEST_PARMS, COMPRESSION_PARMS
INST_CMPRS_COLOR_MODE	Group COMPRESSION_PARMS
